Cylindrical Roller Bearing Types

- NU style single row
- N style single row
- NJ style single row
- NF style single row
- NH style single row
- NUP style single row
- Double row styles (NN, NNU)

Cylindrical roller bearings are designed to carry heavy radial loads and are suitable for high speed applications. Their rolling elements are ground to provide maximum contact with the raceway and are precisely crowned to avoid edge loading due to shaft misalignment.

NU style bearings have two machined flanges on the outer ring and no flanges on the inner ring. The rollers and cages are assembled in the outer ring. Because there are no flanges in the inner ring, this bearing cannot carry a thrust load.

N style bearings have two machined flanges on the inner ring and no flanges on the outer ring, with rollers and cage on the inner ring. Like the **NU** style, the **N** has no thrust load carrying capability.

NJ style bearings have two machined flanges on the outer ring and a machined flange on one side of the inner ring. The roller and cage assembly is in the outer ring. The integral flange on the inner ring allows this bearing to carry an axial load.

NF style bearings have two machined flanges on the inner ring and one flange on the outer ring, with roller and cage on the inner ring. Like the **NJ** bearing, these bearings have some thrust load capability.

NH style bearings have two machined flanges on the outer ring and a machined flange on one side of the inner ring. A special-design inner ring allows use of a stabilizing ring on the non-flange side. As a result, these bearings can carry axial loads in both directions. The roller and cage assembly is mounted in the outer ring.

NUP style bearings are similar to the **NJ** style and come with a special ring often called a thrust collar. Mounted on the non-flange side of the inner ring, the thrust collar allows the bearing to carry an axial load in both directions. The thrust collar extends out of the bearing on one side, so the dimension across the inner ring is slightly greater than that of the outer ring.

Double Row cylindrical roller bearings are denoted by two N's within the part number (e.g., **NN** or **NNU**). The dimensions for these can be found in the Super Precision section of this catalog and can be ordered with standard precision.

Basic Bearing Life - Introduction

2.1.2 Required Basic Life

With the aid of the life equations according to section 2.1.1, the correct bearing size can be selected, if the required life is known from the conditions of the machine operation and the requirements on the operating reliability. If data concerning the required life is not available, approximate values can be obtained from figure 1.

2.1.3 Service Life

The service life is the life actually reached by a roller bearing, which can deviate from the calculated life. For instance, misalignment between shaft and housing, contamination of the bearings, too high operating temperatures or insufficient lubrication may cause premature failure due to wear or fatigue.

Unfavorable operating conditions such as oscillating bearing motion with very small angles of oscillation, or vibrations of the bearings while not rotating, may also cause premature bearing failure due to brinelling.

Considering the multitude of applications and operating conditions, the service life of bearings cannot be exactly determined. The safest way to estimate the service life, now as before, is by comparison with similar applications.

2.2 Static Load Carrying Capacity

The static load carrying capacity is limited by the permanent deformation of the rolling elements and raceways, which is still considered permissible with the regard to to the noise level during subsequent bearing operation. This definition of permissible permanent deformation leads to the term static load rating. The measure of static load rating is defined by the static load safety factor.

2.2.1 Static Load Safety Factor

The static load safety factor indicates the safety against the permissible permanent deformation in the bearing and is defined as follows:

$$S_0 = C_0 / F_0 \quad (4)$$

S_0 —
static load safety factor

C_0 lbf
basic static load rating. In radial bearings, C_0 is the load in the radial direction and in thrust bearings the concentrically acting axial load, for which the Hertzian pressure between the rolling elements and the raceways at the most highly loaded position in the bearing reaches the value 580,000 psi (4000 N/mm²). This load causes, under normal contact conditions, a permanent total deformation of 1/10,000 of the rolling element diameter.

F_0 lbf
maximum load of the radial or thrust bearings

2.2.2 Required Static Load Safety Factor

The guideline values shown in table 1 are recommended for the static load safety factor.

Table 1 • Recommended static load safety factor

Application	S_0
Quiet, vibration free operation with low demands for smooth running; bearings with only slight rotational movement.	≥ 1
Normal operation with higher demands for smoother running	≥ 2
Operation with distinct shock loads	≥ 3
Bearing arrangements with high demands for accuracy and smooth running	≥ 4

For shell bearings, the value $S_0 \geq 3$ should be used.

2.3 Influences on the Load Carrying Capacity

The basic load ratings shown in this catalog are valid for a hardness of 670 to 840 HV (RC 58 to 65) for raceways and rolling elements with a fine grain material structure which is characteristic for rolling bearing components.

Basic Bearing Life - Applications

a_1 —
factor for reliability other than 90%

a_2 —
material factor

a_3 —
factor for operating conditions, especially for lubrication conditions.

Under normal conditions $a_1 = a_2 = a_3 = 1$, so equation (3) is identical to equation (1).

For determination of the adjustment factors, it is necessary that all operating conditions (individual loading conditions, influence of misalignment, bearing temperature, etc.) are exactly known. If this is the case, the adjustment factors can be determined, based on special guidelines, by the INA Engineering Department and then substituted into equation (3).
