

SNI- and SN - Plummer Block Housings are split bearing housings for the fitting of self aligning ball or spherical roller bearings which are fixed to the shaft either by shrink fitting or with an adapter sleeve. They are designed for grease lubrication only and can be supplied with lubrication holes if required.. The dimensions of SNI- Housings comply with specifications laid down in DIN 736 & 737, whereas those of the SN- Housings correspond to DIN 736 till 739.

The bearing seat of SNI-Housings is manufactured in tolerance H8, that of SN-Housings in tolerance H7. A locating bearing is obtained by fitting one or two fixing rings between housing shoulder and bearing outer ring.

These Plummer Block Housings are supplied as standard with felt seals. For special applications such as high temperatures, heavy dirt loads etc, it is possible to fit these housings with a variety of seal arrangements.

When used as an end bearing (Arrangement A) a cover plate is supplied for one side instead of the normal seal.

Under the reference SSNI these housings can be supplied with reinforced base. Normally the housings do not have holes in the base. On request however, they can be supplied with either 2 or 4 mounting holes.

Materials

SNI- and SN- Plummer Block Housings are manufactured from Grey Cast Iron GG20. Housings from Spheroidal Cast Iron GGG 40 or Cast Steel GS 45 are also available for applications where housings with greater strength are required.

Loadability of the Housings

SNI- and SN- Plummer Block Housings are designed for loads applied vertically to the bridging surface. In these instances the permissible load is determined by the load rating of fitted bearing. Should loads be applied at other angles, checks should be carried out to determine whether they are still valid for the housing, the housing connecting bolts and the mounting bolts.

Values of the housing breaking load Q , for various load directions are listed in the table on page 26. A factor of 1.8 x applies to housings from material GGG 40 & GS 45.

Bolts to strength class 8.8 are supplied as standard for joining the housing upper and lower parts.

Maximum values for the connecting bolts for various load directions are listed in the table on page 27.

It is to be ensured that, when loading the housings, the connecting bolts and holding down bolts are tightened correctly.

Lubrication

SNI- and SN- Plummer Block Housings are designed solely for grease lubrication. In the majority of cases the grease filling applied during initial assembly will be sufficient to last until the general inspection. Under certain conditions however, regreasing may be necessary. We can affix the adequate lubrication hole to the housing, if required. For bearing applications in the ventilation or fan assembly where due to high speeds, a continuous lubrication is necessary, we supply SN housing variations SN..VS, SN..R with grease regulators, (see page 29)

Seals for Plummer Block Housings

Depending on the application, the plummer block can be fitted with various seals. Felt seals are simple seals which allow a circumferential speed of 4m/s. Before fitting felt seals they should be soaked in warm oil for several minutes. Should temperatures be in excess of 100 °C the felt seal should be replaced with a temperature resistant seal.

The double lip seal is split and allows a circumferential speed of 8m/s. Attention should be paid to ensure that the gap between the two sealing lips is filled with grease during assembly and that the sliding surface on the shaft is polished.

With high speeds and difficult operating conditions we recommend fitting either single or double labyrinth seals. Perbunan cord supplied with the seals is inserted between the labyrinth seal and shaft and ensures that the seals rotate with the shaft. An out of alignment of upto 0.4° between shaft and housing is permissible.

With continuous temperatures above 100 °C, a cord of heat resistant material must be used. When regreasing the bearing centre should also be regreased where possible.

If the double labyrinth seal is used, it is possible to fill the labyrinth with grease by using a grease nipple, thus a additional sealing is achieved.

For extremely difficult and raw operating conditions we offer diverse special seals. Please contact our technical department in such cases.

Types of Seal

Felt strip or graphited cord seal

Double Labyrinth seal

Double lip seal

Taconite seal
(Standard execution)

V- ring seal

Taconite seal
(Special execution)

Labyrinth seal

Felt strip with Labyrinth seal

Plummer Blocks (split) DIN 738 + 739

Series SN 2 and SN 3

For self-aligning ball bearings or spherical roller bearings
with cylindrical bore
