IKO Crossed Roller Bearing

CRBF · CRBH **CRB · CRBS**

Features of Crossed Roller Bearing

High load capacity and high rigidity.

Taking load of any direction and moment at the same time.

Compactness contributes your space saving.

Wide mounting variations for your best choice.

IKO Crossed Roller Bearings are compact bearings with their rollers alternately crossed at right angles to each other between inner and outer rings. The rollers make line-contact with raceway surfaces, and, therefore, elastic deformation due to bearing loads is very small. They can take loads from any directions at the same time such as radial, thrust and moment loads. It is possible to make your design compact comparing to the usage of taper roller bearing and combination of two ball bearings. These bearings are widely used in the rotating parts of industrial robots, machine tools, medical equipment, etc., which require compactness, high rigidity and high rotational accuracy.

Wide variations

Variations of Mounting Holed Type High Rigidity Crossed Roller Bearing

Type	Guidance of cylindrical roller	Sealing structure	Model code	Shaft diameter
 <p>Mounting Holed Type High Rigidity Crossed Roller Bearing Mounting holes are prepared on outer ring and inner ring providing easy mounting together with high rigidity and high accuracy.</p>	With separator	Sealed type	CRBF...AUU	10-80 mm
		Open type	CRBF...A	10-80 mm

Features of Mounting Holed Type High Rigidity Crossed Roller Bearing

High Rigidity and Accuracy

Both inner ring and outer ring have solid one-piece construction. Can directly mount onto the equipment through prepared mounting holes. Therefore, high accuracy and high rigidity are realized and mounting error can be minimized.

Space Saving

Housing and fixing plate are not necessary for mounting, and the room around the bearing can be minimized.

Smooth Rotation

Special separators are incorporated between cylindrical rollers allowing smooth and high-speed rotation.

Mounting method

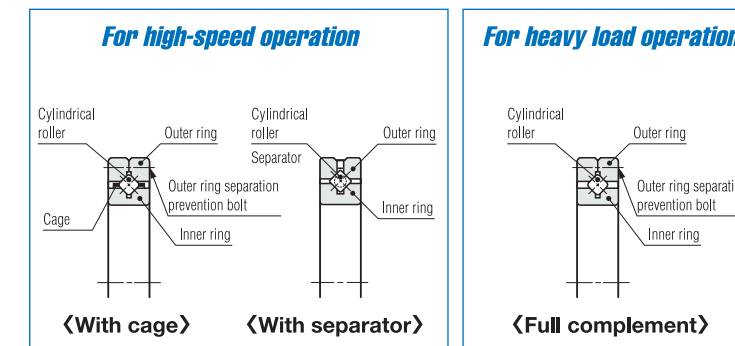

Variation of Crossed Roller Bearings

Type	Guidance of cylindrical roller	Sealing structure	Model code	Shaft diameter
 <p>High Rigidity Type Crossed Roller Bearing Both inner and outer ring have solid one-piece construction. High rigidity and high accuracy together with smooth rotation is provided by separator.</p>	With separator	Sealed type	CRBH...AUU	20-250 mm
		Open type	CRBH...A	20-250 mm
 <p>Standard Crossed Roller Bearing With cage and full complement, open type and sealed type are available. Wide size variations from 30mm to 800mm shaft diameter are available.</p>	With cage	Sealed type	CRBC...UU	30-300 mm
		Open type	CRBC	30-800 mm
	Full complement	Sealed type	CRB...UU	30-300 mm
		Open type	CRB	30-800 mm
 <p>Slim Type Crossed Roller Bearing Very slim bearing having an extremely thin inner and outer rings.</p>	With separator	Sealed type	CRBS...AUU	50-200 mm
	With cage	Open type	CRBS	50-200 mm
	Full complement	Sealed type	CRBS...VUU	50-200 mm
		Open type	CRBS...V	50-200 mm

Guidance of cylindrical roller

Separator and cage types suite to the application requires low driving energy and high-speed rotation. Full complement type is suitable to low-speed rotation, heavy load and/or oscillating motion.

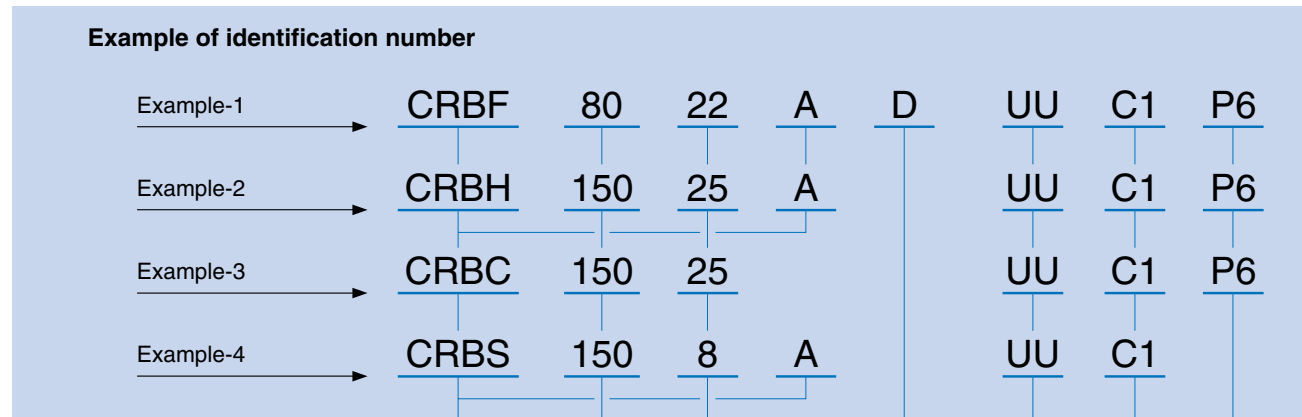

Sealing structure

Open type is suitable to the low energy application due to no sealing friction. Sealed type incorporates seals made of special synthetic rubber that have excellent sealing performance against dust and dirt penetration, also prevent grease leakage.

Identification Number

The identification number of IKO Crossed Roller Bearings consists of a model code, dimensions, any supplemental codes and classification symbols as shown below.

- ① Model code
- ② Bore diameter of bearing
- ③ Width of bearing
- ④ Supplemental code-1
- ⑤ Supplemental code-2
- ⑥ Supplemental code-3
- ⑦ Classification symbol

① Model code	CRBF ... A	Mounting Holed Type High Rigidity Crossed Roller Bearing (With separator)
	CRBH ... A	High Rigidity Crossed Roller Bearing (With separator)
	CRBC	Standard Crossed Roller Bearing (With cage)
	CRB	Standard Crossed Roller Bearing (Full complement)
	CRBS	Slim Type Crossed Roller Bearing (With cage)
	CRBS ... A	Slim Type Crossed Roller Bearing (With separator)
	CRBS ... V	Slim Type Crossed Roller Bearing (Full complement)

② Bore diameter of bearing	Bore diameter of bearing (unit: mm)
-----------------------------------	-------------------------------------

③ Width of bearing	Width of bearing (unit: mm)
---------------------------	-----------------------------

④ Supplemental code-1 (Mounting holes)	T	: With female threaded mounting holes on the inner ring
	No symbol	: With counter-bored mounting holes on both inner ring and outer ring in the same direction.
	D	: With counter-bored mounting holes on both inner ring and outer ring in the opposite direction.

Remark: Applicable to High Rigidity Crossed Roller Bearing only.

⑤ Supplemental code-2 (Seal specification)

- No symbol : Open type
 - UU : Two sides sealed type
 - U : One side sealed type
 - UD : One side sealed in the opposite direction to counter bored mounting holes on outer ring
- For applicable codes, see Table 1.

Load Rating and Life

Basic dynamic load rating C

The basic dynamic load rating is defined as a constant radial load both in direction and magnitude under which a group of identical bearings are individually operated and 90% of the bearings in the group can rotate 1 million revolutions free from material damage due to rolling contact fatigue.

Life

The basic rating life of IKO Crossed Roller Bearings is obtained from the following formula.

$$L_{10} = \left(\frac{C}{P_r}\right)^{10/3} \quad (1)$$

where, L_{10} : Basic rating life, 10^6 rev.
 C : Basic dynamic load rating, N
 P_r : Dynamic equivalent radial load, N

If the number of revolutions per minute is known, the rating life in hours can be obtained from the following formula.

$$L_h = \frac{10^6 L_{10}}{60n} \quad (2)$$

where, L_h : Basic rating life in hours, h
 n : Number of revolutions per minute, rpm

Life in oscillating motion

When a bearing is used in oscillating motion, the life can be obtained from the following formula.

$$L_{oc} = \frac{90}{\theta} \left(\frac{C}{P_r}\right)^{10/3} \quad (3)$$

where, L_{oc} : Basic rating life in oscillating motion, 10^6 cycle
 2θ : Oscillating angle, degrees (Refer to Fig.1.)
 P_r : Dynamic equivalent radial load, N

If the number of oscillations per minute n_1 cpm is given, the rating life in hours can be obtained from Formula (2) by substituting n_1 for n .

When the oscillating angle 2θ is very small, oil film may not be formed between the rolling elements and the raceways, and fretting corrosion may occur. In this case, please consult IKO.

Fig.1 Oscillating motion

Limitations of life formulae

The above life formulae are applicable when the mounting and lubrication of bearing are normal and the bearing is used without intrusion of foreign matters under a normal operating condition and not under extreme severe condition.

If these conditions are not satisfied, the actual life may decrease rapidly.

For example, it is necessary to consider the additional factors, such as deformation of bearing by miss-mounting, large deformation of housing/shaft, large preload and use of unsuitable grease.

Furthermore, when the dynamic equivalent radial load exceeds 1/2 of the basic dynamic load rating, the life calculation formulae may not be used.

Dynamic equivalent radial load

The dynamic equivalent radial load of IKO Crossed Roller Bearings can be obtained from the following formula.

$$P_r = X\left(F_r + \frac{2M}{D_{pw}}\right) + YF_a \quad (4)$$

where, P_r : Dynamic equivalent radial load, N
 F_r : Radial load, N
 F_a : Axial load, N
 M : Moment, N·mm
 D_{pw} : Pitch circle diameter, mm ($D_{pw} \approx \frac{d+D}{2}$)
 X : Radial load factor (Refer to Table 2.)
 Y : Axial load factor (Refer to Table 2.)

Fig.2 Load direction

Table 2 Radial load factor and axial load factor

Conditions	X	Y
$\frac{F_a}{F_r + 2M/D_{pw}} \leq 1.5$	1	0.45
$\frac{F_a}{F_r + 2M/D_{pw}} > 1.5$	0.67	0.67

Basic static load rating C_0

Basic static load rating is defined as a static load which gives a prescribed contact stress at the center of contact area between rolling elements and raceways on which the maximum load is applied.

Static safety factor

The static safety factor, f_s , of IKO Crossed Roller Bearings can be obtained from the following formula, and general values of this factor are shown in Table 3.

$$f_s = \frac{C_0}{P_{0r}} \quad (5)$$

where, f_s : Static safety factor
 C_0 : Basic static load rating, N
 P_{0r} : Static equivalent radial load (maximum load), N

Table 3 Static safety factors

Operating conditions	f_s
When high rotational accuracy is required.	≥ 3
Normal operation	≥ 1.5
When smooth rotation is not important under normal operation. Rotation without vibration. When bearing rotation is very little or none	≥ 1

Static equivalent radial load

The static equivalent radial load of IKO Crossed Roller Bearings can be obtained from the following formula.

$$P_{0r} = F_r + \frac{2M}{D_{pw}} + 0.44F_a \quad (6)$$

where, P_{0r} : Static equivalent radial load, N
 F_r : Radial load, N
 F_a : Axial load, N
 M : Moment, N·mm
 D_{pw} : Pitch circle diameter, mm ($D_{pw} \approx \frac{d+D}{2}$)

Load factor

Actual loads applied to the Crossed Roller Bearing sometimes exceed the theoretically calculated load due to the vibration and shocks caused by machine operation. The life is calculated from the following formula while considering the load factor shown in Table 4.

$$F = f_w F_c \quad (7)$$

where, F : Load for life calculation, N
 f_w : Load factor (See Table 4)
 F_c : Theoretical calculated load, N

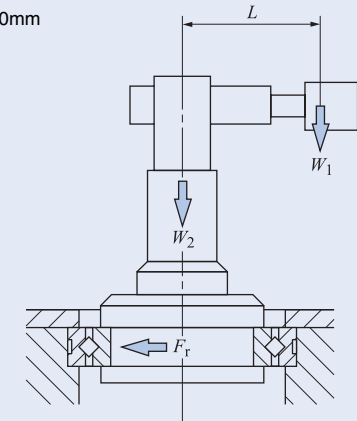

Table 4 Load factor

condition	f_w
Smooth operation free from vibration and/or shocks	1 ~ 1.2
Normal operation	1.2 ~ 1.5
Operation with shock loads	1.5 ~ 3

Life calculation example

BearingCRBH15025A
 Bore diameter $d = 150$ mm
 Outside diameter $D = 210$ mm
 Basic dynamic load rating $C = 84300$ N
 Basic static load rating $C_0 = 138000$ N

$W_1 = 400$ N
 $W_2 = 2000$ N
 $F_r = 2800$ N
 $L = 700$ mm

Calculate the life and the static safety factor under the above conditions.

Radial load : $F_r = 2800$ (N)
 Axial load : $F_a = W_1 + W_2 = 400 + 2000 = 2400$ (N)
 Moment : $M = W_1 L = 400 \times 700 = 280000$ (N·mm)

Pitch circle diameter : $D_{pw} \approx \frac{d+D}{2} = \frac{150+210}{2} = 180$ (mm)

$$\frac{F_a}{F_r + 2M/D_{pw}} = \frac{2400}{2800 + 2 \times 280000/180} \approx 0.406 < 1.5$$

Therefore ; $X = 1$, $Y = 0.45$

The theoretically calculated dynamic equivalent radial load P_r is ;

$$P_r = X\left(F_r + \frac{2M}{D_{pw}}\right) + YF_a = 1 \times \left(2800 + \frac{2 \times 280000}{180}\right) + 0.45 \times 2400 \approx 6990$$
 (N)

And the theoretically calculated static equivalent radial load P_{0r} is ;

$$P_{0r} = F_r + \frac{2M}{D_{pw}} + 0.44F_a = 2800 + \frac{2 \times 280000}{180} + 0.44 \times 2400 \approx 6970$$
 (N)

Therefore, the basic rating life L_{10} is ;

$$L_{10} = \left(\frac{C}{P_r}\right)^{10/3} = \left(\frac{84300}{6990}\right)^{10/3} \approx 4023$$
 ($\times 10^6$ rev.)

And the static safety factor f_s considering the load factor is ;

$$f_s = \frac{C_0}{P_{0r}} = \frac{138000}{6970} \approx 19.8$$

1N=0.102kgf=0.2248lbs.
 1mm=0.03937inch

Accuracy

Dimensional accuracy and rotational accuracy of IKO Crossed Roller Bearings are shown in Tables 5 and 6. And those of High Rigidity Type Crossed Roller Bearing are shown in Table 7 and 8, and Slim Type Crossed Roller Bearing is shown in Table 9. Bearings with special accuracy are also optionally available. Please consult IKO.

Fit

The standard fits of IKO Crossed Roller Bearings are shown in Table 11.1.

Those of Slim Type Crossed Roller Bearings with normal clearance are shown in Table 11.2. For large bearings, fit based on the actual measured dimensions of the bearings is recommended, and fit allowance should be chosen as small as possible in accordance with the tolerance class given in Table 11.1. When complex loads and / or shock loads are applied or when high rotational accuracy and rigidity of the bearing are required, it is recommended to use a slight interference fit adjusted to the actual measured dimensions for both inner and outer rings.

For the interference fit, the radial internal clearance after the fit is decreased by approximately 70% to 90% of the interference amount. To avoid excessive preload due to fit, it is recommended to use a slight interference fit adjusted to the actual measured dimensions for both T1 and C1 clearances.

Allowable rotational speed

Allowable rotational speeds of Crossed Roller bearings are affected by mounting and operating conditions. The values in general operation are shown in Table 12.

Table 12 $d_m n$ values⁽¹⁾ of Crossed Roller bearings

Type	Lubricant		Grease	Oil
	Open type	Sealed type		
With cage or separator	Open type	Sealed type	75 000	150 000
	Open type	Sealed type	60 000	—
Full complement	Open type	Sealed type	50 000	75 000
	Open type	Sealed type	40 000	—

Note(1): $d_m n$ Value = $d_m \times n$

where, d_m : Mean values of bearing bore and outside diameters, mm
 n : Number of rotations per minutes, rpm

Table 11.1 Recommended fits for Crossed Roller Bearings under normal load

Radial internal clearance	Inner ring rotating load		Outer ring rotating load	
	Shaft	Housing bore	Shaft	Housing bore
C1 clearance	h5	H7	g5	J7 ⁽¹⁾
C2 clearance	j5	H7	g5	J7 ⁽¹⁾

Note(1): It is recommended that a slight interference fit adjusted to the actual measured dimensions of the bearing is used.

Rotational torque

Rotational torque of IKO Crossed Roller Bearings is lower than that of plain bearings and the difference between the static torque and the dynamic (kinetic) torque is small. Therefore, this bearing minimizes power consumption and operating temperature rise of machinery and increases the overall efficiency of the machine.

The rotational torque is affected by many factors, and the following formula is used.

$$T = \mu P_{0r} \frac{D_{pw}}{2}$$

where, T : Rotational torque, N·mm

μ : Friction coefficient (Approx. 0.010)

P_{0r} : Static equivalent radial load, N

D_{pw} : Pitch circle diameter, mm ($D_{pw} \approx \frac{d+D}{2}$)

If the radial clearance after mounting is a large minus value, consult IKO.

Lubrication

These bearings are generally lubricated with grease. In re-lubrication, grease can be supplied through the clearance between the outer ring and inner ring.

In the sealed type bearings, ALVANIA EP grease 2 (SHELL) is prepacked as standard.

For the bearings supplied without lubricant, customer is supposed to apply lubricant. Operating without grease or oil will increase the wear of the rolling contact surfaces and cause a short bearing life.

When using special grease, carefully examine the grease properties and contents such as base oil viscosity and extreme pressure additives. In this case, please contact IKO.

Oil hole

For Crossed Roller Bearings, oil holes and oil grooves can be provided by request. When an oil hole is required on the outer ring, attach "-OH" before the clearance symbol in the identification number. When an oil hole and oil groove are required on the outer ring, attach "-OG" in the same manner. For an oil hole on the inner ring, attach "/OH", and for an oil hole and oil groove on the inner ring, attach "/OG", in the same manner as well. High Rigidity Type Crossed Roller Bearings have an oil groove and two oil holes on the outer ring as standard. Table 13 shows availability of oil holes for each bearing type.

Table 13 Oil holes

Bearing type	Oil hole code			
	/nOH	/nOG	-nOH	-nOG
CRBF	—	—	—	— ⁽²⁾
CRBH	○	○	—	— ⁽²⁾
CRB	○	○	○	○
CRBC	○	○	○	○
CRBS	○	—	○	—

Note(1): Only representative types are shown in the table, but this table is applicable to all Crossed Roller Bearings.

(2): CRBH and CRBF are provided with an oil groove and two oil holes on the outer ring.

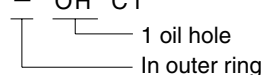

Remark: n denotes the number of oil holes not exceeding 4. For one oil hole, number is not indicated.

When preparing multiple oil holes, please consult IKO.

Example 1 In case of 4 oil holes in the inner ring

CRBC 10020 / 4OH C1

Example 2 In case of 1 oil hole in the outer ring

CRBC 10020 - OH C1

Operating temperature range

The operating temperature range for Crossed Roller bearings is -20°C to +120°C. However, the maximum allowable temperature for those with separator and with seal is +110°C, and +100°C when they are in continuous use under such temperature.

Mounting

When the rigidity of the mounting parts is not sufficient, stress concentration will occur at the contact area between the rollers and raceways, and the bearing performance will be deteriorated significantly.

Therefore, it is necessary to carefully examine the rigidity of housing and the strength of fixing bolts when a large moment will be applied.

The shoulder height diameters (d_a and D_a) that are related to mounting should certainly satisfy the values shown in the dimension tables. When these dimensions are incorrect, deformations of inner and outer rings will occur and the bearing performance will be deteriorated remarkably.

1. For Mounting Holed Type High Rigidity Crossed Roller Bearing

Fig.3 Mounting example -1
Mounting Holed Type High Rigidity Crossed Roller Bearing

① Mounting Holed Type High Rigidity Crossed Roller Bearing can be mounted directly to the mounting surface by fixing bolts. (See Fig.3)

Fig.4 Mounting example -2
Mounting Holed Type High Rigidity Crossed Roller Bearing

② If large number of radial load and/or moment is expected, it is recommended to prepare flange part. (See Fig.4)

③ Mounting Holed Type High Rigidity Crossed Roller Bearing has a plug for hole for inserting cylindrical rollers. When mounting the bearings, locate the plug at a position that is not included in the maximum loading zone. The plug location can be found by the pin that is at the side of the outer ring.

2. For other Crossed Roller Bearings

Fig.5 Mounting example (Exept High Rigidity type)

① The inner and outer rings should be securely fixed in the axial direction by using fixing plates, etc. Recommended thickness of the fixing plate is 1/2 or more of the bearing width (B). The dimensions in axial direction of the housing bore and the fixing plates should be decided to get a secure fixing while considering the actual dimension of bearing width which is zero/minus-tolerance. (See Fig.5)

② The depth of housing bore is recommended to be the same to or larger than the bearing width.

③ Separation prevention bolts for the outer ring are provided to prevent separation of the two halves of the outer ring during transportation or mounting. When mounting, they should be loosened slightly.

④ High Rigidity Crossed Roller Bearing has a plug for hole for inserting cylindrical rollers. When mounting the bearings, locate the plug at a position that is not included in the maximum loading zone. The plug location can be found by the pin that is at the side of the outer ring.

As a *Forerunner* in needle roller bearing manufacturing,
we supply products that are the best match to your requirements.

Standard numbers at anytime

Needle Roller Bearings

General Catalog

CAT-5502

- Shell Type Needle Roller Bearing Series
- Machined Type Needle Roller Bearing Series
- Cam Followers
- Roller Followers
- Needle Cages
- Crossed Roller Bearings
- Combined Type Needle Roller Bearing Series
- Spherical Bushings
- PILLOBALLS
- etc.

You can select from many sizes and types of **IJKO** bearings for the best matching to your requirements in various applications.

Varieties of *Cam Followers* that meet every need in industry.
They are used in machine tools, pallet changers, cam mechanisms for industrial robots, etc.

Cam Followers & Roller Followers leading the world

Cam Followers & Roller Followers

General Catalog

CAT-5503

We supply many different types and sizes of **Cam & Roller Followers** in both metric and inch dimensions. Keep this catalog at hand for your daily use.

CD-ROM CATALOGS

IJKO general catalogs CD-ROM version of Linear Motion Rolling Guide Series (CD-5505) and Needle Roller Bearing Series (CD-5502) have been newly released.
