

Link-Belt® Spherical Roller Bearing

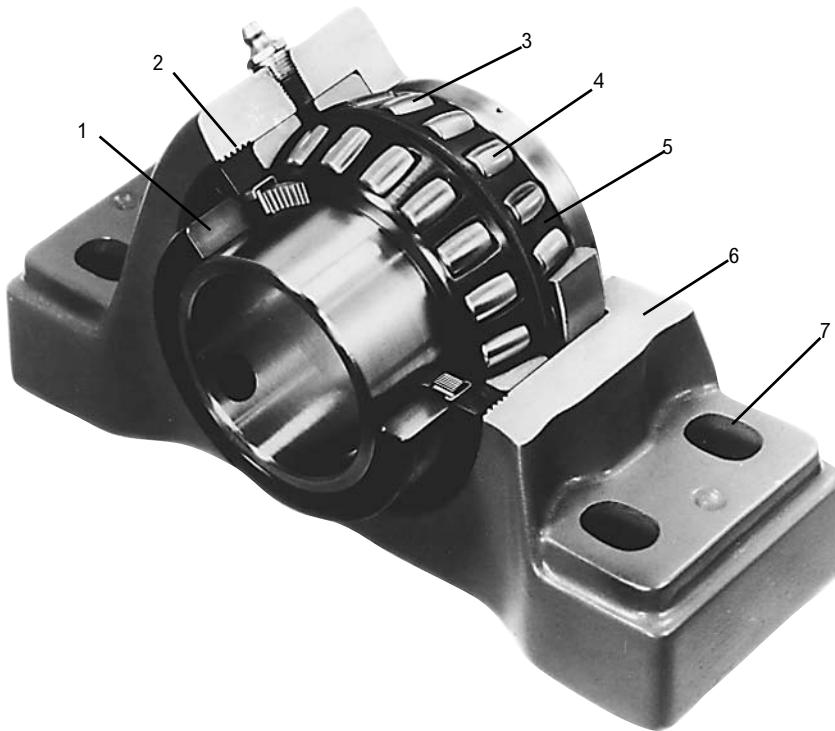

**Easy to mount,
sealed, pre-lubricated
and do not require
bearing adjustment
during mounting.**

Series B22400, B22500 & B22600 Spherical Roller Bearing Units and Takeups – Features and Benefits

Series B22400 are single collar mounted spherical roller bearing units. Series B22500 are double collar mounted spherical roller bearing units. Series B22600 are adapter mounted spherical roller bearing units. These units provide economic

and versatile arrangements for supporting shafts carrying substantial radial or combination radial and thrust loads. These units are especially adaptable for conveyors, elevators, general industrial machinery, heavier duty fans and blowers, power transmission

applications, ditchers, trenchers, pavers and other such applications. These series of bearings are easy to mount, sealed, pre-lubricated and do not require bearing adjustment during mounting.

**1. Mounting Feature**

- B22400 Series – Spring locking collar locks inner ring securely to shaft.
 - B22500 Series – Two spring locking collars lock inner ring securely to shaft.
 - B22600 Series – Tapered adapter mounting system.
2. Choice of three seals, floating labyrinth Type H, spring-loaded lip Type E, and triple lip Type E7.
 3. Long inner ring for high stability and load support.
 4. Self-aligning double row spherical roller bearing adjusts $\pm 2^\circ$ to allow for alignment variations between shaft and supporting structure.
 5. Double contoured retainer pockets assure accurate roller control.
 6. Sturdy, compact one-piece cast iron or cast steel housing.
 7. Slotted bolt holes in pillow block bases facilitate mounting; bottom of base is machined.

Spherical Roller Bearings

Self-aligning double row spherical roller bearings have high LDN values and are designed to distribute the load over the symmetrical rollers, assuring positive tracking and smooth operation. The large roller complement provides high capacity for radial or combined radial-thrust loads.

Oscillation clearance at the ends of the rollers compensates for shock loads and prevents destructive edge loading. These precision bearings with double contoured retainer pockets are designed to meet a broad range of application requirements.

**Spring Locking Collar(s) - B22400 & B22500 Series**

The spring locking collar(s) design provides a secure grip of the wide inner ring bearing to the shaft. The set screws extend through the inner ring of the bearing and lock firmly onto the shaft. Installation is fast and simple. Correctly tightening

the set screws produces elastic strain in the spring locking collar resulting in a continuous pressure on the set screw threads and providing a positive lock.

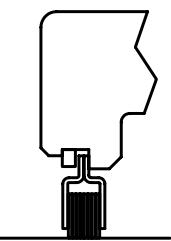

**Adapter Mount – B22600 Series**

The adapter mounting provides better concentricity and shaft control, increasing service life. Where Turned, Ground and Polished shafting is the norm on collar-mounted units, the maximized mounting power of the B22600 allows for Commercial Grade Shafting compatibility (a commonly used grade of shafting due to its price and availability). Shaft damage from set screws is eliminated with the B22600's improved mounting design. Shaft damage

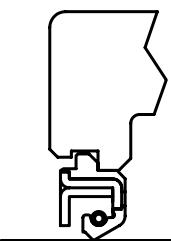

from the bearing inner ring fretting to the shaft (the result of a clearance or loose fit) is also eliminated. These improvements facilitate easier bearing removal, replacement bearing installation and longer shaft service life.

Interchangeable Seals-Seal Types

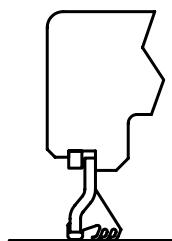

Three standard sealing systems are available each offering maximum protection for the bearing. These seals are interchangeable and are designed for grease lubrication.

Type H Seal

Type H floating labyrinth seals have multiple self-centering rings held securely in a steel carrier. Type H seals are normally furnished.

Type E Seal

Type E spring loaded lip seals utilize a spring to provide uniform pressure for keeping the sealing lip in contact with the inner ring. Type E seals are normally used for liquid splash environments.

Type E7 Seal

Type E7 triple lip seal with metal outboard guard is designed for the most severe of applications. The outboard metal guard protects the inner seal lips from abrasion and damage. The three molded, heavy contact lips provide excellent protection from abrasive media, dust and moisture.

One-Piece Cast Iron or Cast Steel Housings

Compact one-piece housings provide for strength and load support. Scientifically contoured housing design provides superior rigidity. Cast iron or cast steel pillow blocks have two or four slotted bolt holes with ample space

provided for drilling dowel pin holes. Flanged and flanged cartridge units have drilled mounting holes and machined mounting surfaces for maximum stability. Cartridge units have cast iron or steel housings and are finished

to precision tolerances. Takeup units have machined slots for smooth, precise operation. Pillow blocks, flanged, and cartridge units are available for fixed or expansion operation.

Nomenclature

Symbol	Description	P	E	-B22	4	39	F	H	C	17H
C	Cartridge unit									
CSE	Cartridge unit; steel housing									
EF	Flanged unit; 4-bolt square									
EP	Pillow block; cast iron									
F	Flanged unit; 3- and 4-bolt									
FB	Flanged bracket unit									
FC	Flanged cartridge unit; 4-bolt round									
P	Pillow block									
PK	Pillow block; cast steel housing									
T	Takeup unit, slotted guides									
DS	Takeup, conveyor, hinged top, welded steel frame									
DSH	Takeup, conveyor, extra strength, welded steel frame									
R	Collar opposite cover (B22400 only)									
E	Expansion unit (not used with CSE symbol)									
B22	Spherical roller bearing; extended inner ring separable outer rings									
4	400 series designation (one locking collar)									
5	500 series designation (two locking collars)									
6	600 series designation (adapter mounted)									
B	Inner ring bore equal to a bore of preceding smaller bearing group									
39	Shaft diameter in 16ths of an inch									
M55	Metric series, bore in mm									
F	Four bolt base pillow block									
H	Floating labyrinth seal									
E	Spring-loaded lip seal									
E7	Triple lip seal									
C	Closed end unit									
18	Takeup adjustment, inches									
17H	Grease designation									
4	Clearance other than standard									

Series B22400, B22500 & B22600 Spherical Roller Bearing

To select a bearing, determine the applied radial load, the applied thrust load, the desired Rating Life, and applicable operating conditions. The procedure shown here will aid in selecting a bearing to meet an L₁₀ design life. The formulas for calculating life expectancy should be used to determine the Rating Life L₁₀ for the bearing selected.

The selection procedures and rating formulas shown here are in agreement with The American Bearing Manufacturers Association Standards and ANSI/ABMA Standards STD 11-1990. Ratings are based on fatigue life. The Rating Life L₁₀ or fatigue life at 90% reliability is the usual basis for bearing selection. For radial load applications only,

Table 4, can be used to select a bearing or to determine L₁₀ life expectancy.

To assure a satisfactory bearing application, fitting practice, mounting, lubrication, sealing, static rating, housing strength, operating conditions and maintenance must be considered.

Selection**Step 1**

Determine an appropriate L₁₀ design life.

Type of service	Operating time, hours per year	Design life, years	L ₁₀ design life, hours
Light seasonal usage	500 to 750	3-5	3,000
Heavy seasonal usage	1,400 to 1,600	4-6	8,000
Industrial—8 hour shift	2,000	10	20,000
Industrial—16 hour shift	4,000	10	40,000
Industrial—continuous	8,700	10	80,000 to 100,000

Step 2

Determine a required $\left(\frac{C}{P}\right)$ from Table 1.

Step 3

Calculate the required C and select a roller bearing.

a For radial load only:

$$P = F_r \\ \text{required } C = \left(\frac{C}{P}\right) P \text{ using } \left(\frac{C}{P}\right) \text{ from Step 2}$$

Select a roller bearing from Table 2 with a basic load rating C equal to or greater than the required C.

Step 3 (continued)**b For combined radial and thrust loads:**

Select a trial roller bearing of the desired shaft size from Table 2.

Calculate the ratio of thrust load F_a to the radial load F_r.

$$\frac{F_a}{F_r}$$

Calculate the equivalent radial load P

$$P = X F_r + Y F_a$$

If $\frac{F_a}{F_r}$ is equal to or less than e, then $P = X_1 F_r + Y_1 F_a$

If $\frac{F_a}{F_r}$ is greater than e, then $P = X_2 F_r + Y_2 F_a$

For values of e, X₁, Y₁, X₂, and Y₂, see Table 2.

Calculate the required C

$$\text{required } C = \left(\frac{C}{P}\right) P \text{ using } \left(\frac{C}{P}\right) \text{ from Step 2.}$$

Consult Table 2, basic load rating. If a smaller bearing meets, or nearly meets, the required C, its life expectancy can be calculated.

Note: If the load P is greater than .25C, consult Rexnord Bearing Division.

Selection																	
Symbols for formulas:		n = speed, revolutions per minute P = equivalent radial load, pounds (or newtons) X = radial factor Y = thrust factor															
C = basic load rating, pounds (or newtons)																	
Co = static load rating, pounds (or newtons)																	
e = a reference value																	
Fa = thrust load, pounds (or newtons)																	
Fr = radial load, pounds (or newtons)																	
L ₁₀ = rating life, hours

Basic Formula

$$\left(\frac{C}{P}\right) = \left(\frac{L_{10} \times n \times 60}{1,000,000}\right)^{3/10}$$

$$L_{10} = \frac{\left(\frac{C}{P}\right)^{10/3}}{n \times 60} \times 1,000,000$$

Life Expectancy

To calculate the Rating Life L₁₀ of any selected or trial bearing:

Step 1

Determine the equivalent radial load P.

a For radial load only:

$$P = Fr$$

b For combined radial and thrust load:

$$P = XFr + YFa$$

if $\frac{Fa}{Fr}$ is equal to or less than e, then

$$P = X1Fr + Y1Fa$$

if $\frac{Fa}{Fr}$ is greater than e, then

$$P = X2Fr + Y2Fa$$

For values of e, X1, Y1, X2, and Y2, consult the appropriate bearing rating Table 2.

Step 2

Calculate the ratio of the basic load rating C to the equivalent radial load.

$$\left(\frac{C}{P}\right)$$

Step 3

Approximate the bearing life from Table 1.

Life Adjustment

The Rating Life, L₁₀, may be modified for some applications in accordance with the formula

$$Ln = a_1 a_2 a_3 L_{10}$$

where Ln = Adjusted life for (100-n) % reliability,

a₁ = Life adjustment factor for reliability

a₂ = Life adjustment factor for material and processing

a₃ = Life adjustment factor for operating conditions.

For most normal applications, all factors will be taken as 1, and the Rating Life used as the selection basis or life estimate. In addition, as long as standard catalog bearings are used, a₂ will be normally set equal to one.

The factor a₃ covers such things as lubrication, misalignment, and temperature. Some conditions that could yield a₃ significantly different than unity include speeds less than 20000 DN or greater than 200000 DN, temperatures below -40°F (-40°C) or above 275°F (135°C). For other possible conditions, as well as additional information on life adjustment factors, consult Rexnord Bearing Division.
