WHY MISUMI?

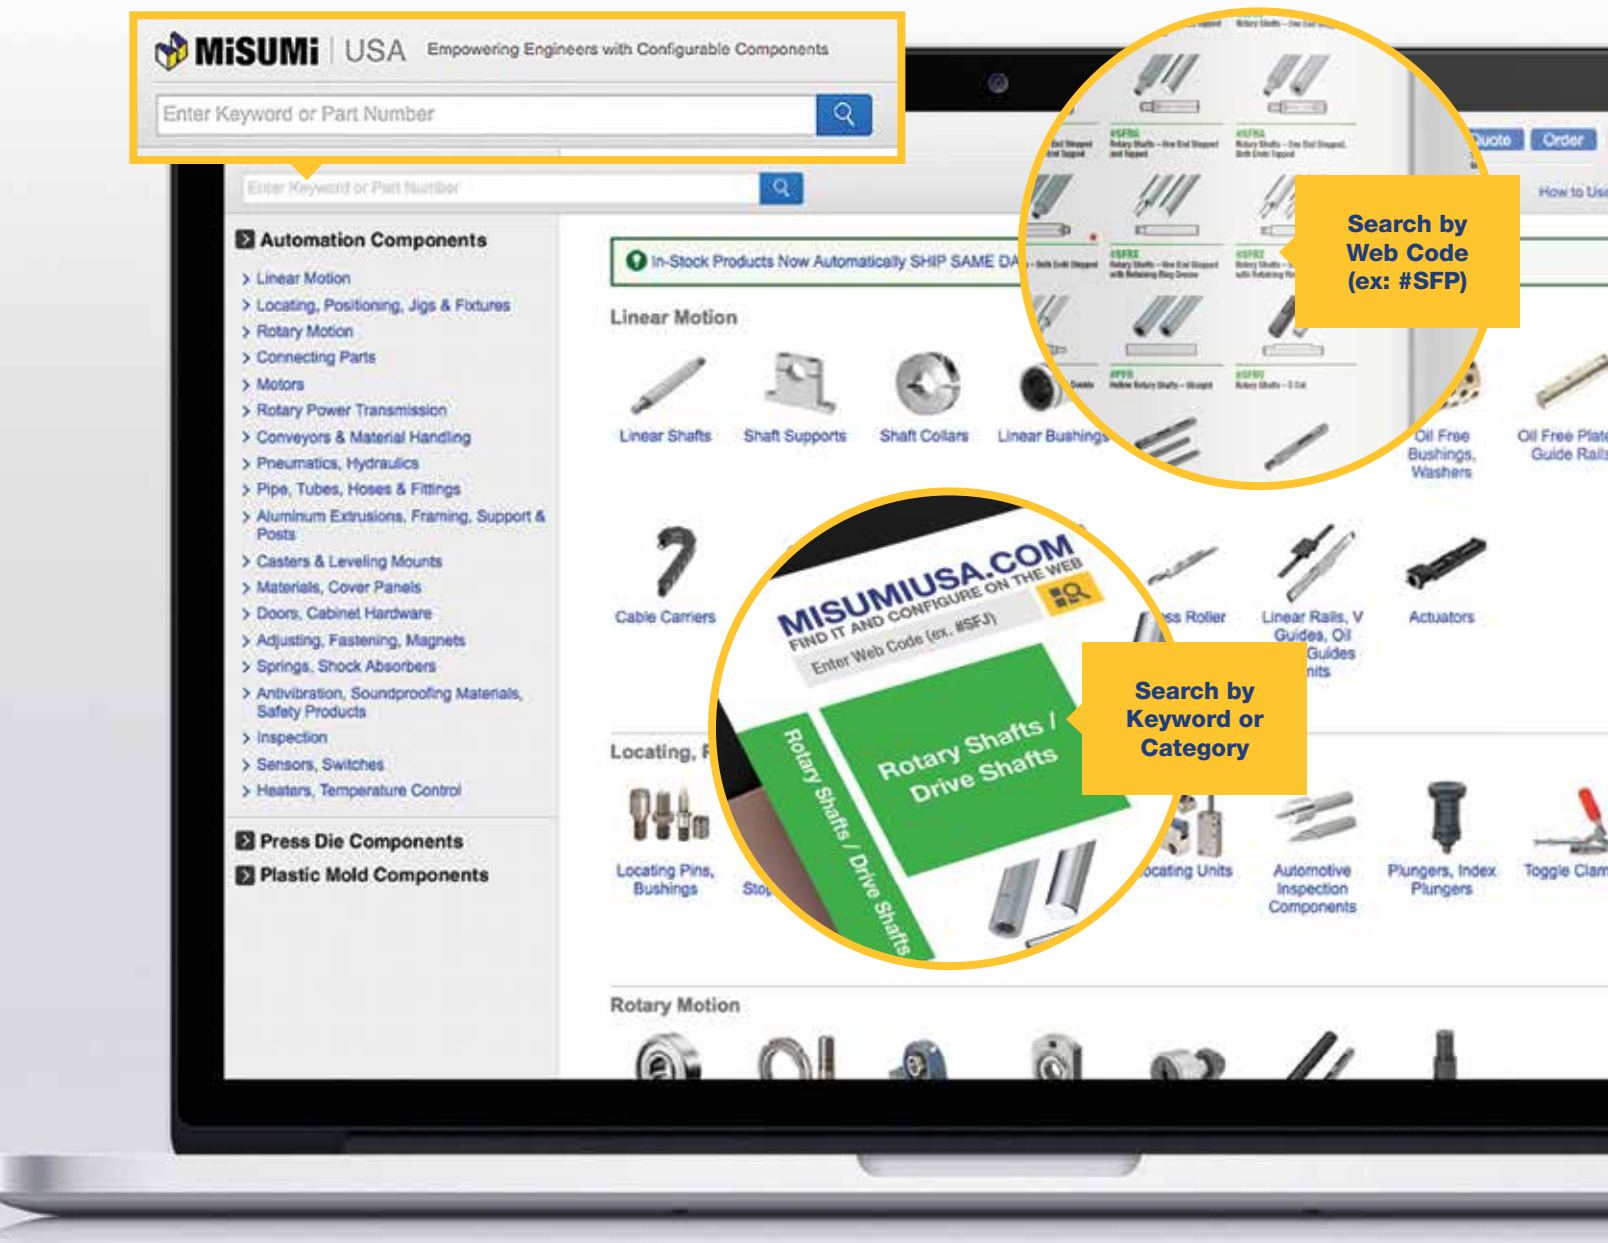
Our mission is to provide innovative configurable products that fulfill our customers' needs for high quality, competitive prices and short delivery times. MISUMI currently serves over 150,000 customers worldwide. MISUMI's products can be utilized in a diverse range of industries including automotive, medical, semiconductor, packaging and 3D Printing.

Find the product you're looking for easily & quickly on misumiusa.com.

Jump from paper to web by product type in seconds

MISUMI e-commerce makes it possible to find, configure, download CAD Data and place orders. Just type the product Web Code or Product Keyword.

Insert Web Code or Keyword (ex: #SFP or Linear Shaft)



Configurable ordering made easy.

Only MISUMI offers a completely configurable choice.

Configuring your MISUMI components to your exact specifications is easy with our 3D CAD downloads, free engineering support, and over 9 million configurable components.

Product Name	Linear Bushings	Oil Free Bushings	Ball Splines	Linear Guides
Page	pgs. 15–16	pgs. 18–19	pg. 17	pgs. 21–22
Usage/Picture				
Typical Usage	Provides smooth linear motion. Runs at higher speed than plain bushings. Used with hardened shafts.	Used for heavy loads in dirty enviroments. Can be used with hardened and unhardened shafts. Most don't require lubrication.	Use for high speed linear motion under high torsional loads.	Used for smooth and high accuracy motion under heavy loads and moment loads.
Motion Type	Linear*	Linear / Rotary	Linear	Linear
Size	Ø3–50 mm	Ø5–100 mm	Ø6–30 mm	Height 6–42 mm
Materials	– Steel – Stainless Steel	– Copper Alloys (Brass, Bronze) – Steel – Resins (PTFE, Polyacetal)	– Steel – Stainless Steel	– Steel – Stainless Steel
Available Coatings	– Electroless Nickel – Low Temperature Black Chrome	N/A	N/A	– Low Temperature Black Chrome
Load Capacity	Medium	Medium–High	Medium–High	High
Operating Temp.	-20 to 120 °C	-200 to 200 °C	-10 to 120 °C	Standard (-10 to 120 °C) Heat Resistant (-100 to 150 °C)
Accuracy	Medium	Low	Medium–High	Medium–High
Cost $	$$	$	$$$$	$$$$

Unit Conversions: °F = (°C * 1.8) + 32 (Example: °F = (100°C * 1.8) + 32 = 212°F)
*Stroke bushings can handle rotary motion

Example

Product Name	Friction Power Transmission		Synchronous Power Transmission	
	Flat Belts	Round Belts	Timing Belts	Chains
Usage, Picture				
Torque	Medium	Low	High	High
Speed	High	Medium	Low to High	Low–Medium
Efficiency	94–98%	92–97%	95–99%	91–98%
Advantages	– Flexible (serpentine and twisted drives) – Transmit torque over long distance – Various materials (polyurethane, rubber, stainless steel) and colors – No lubrication	– Flexible (serpentine and twisted drives) – Soft belts (typically don't require additional tensioning) – No lubrication	– Quiet compare to chains – Require less tension than other belts – No stretch – No lubrication – No slippage	– Higher operating temp. than belts – Increased load capacity with multi-strand chains – Long operating life – No slippage
Drawbacks	– Creep and slip – High tension needed – Endless belts can't be repaired – Extreme temp. ranges, high moisture, oil, chemicals, etc can damage belts	– Creep and slip – Endless belts can't be repaired – Extreme temp. ranges, high moisture, oil, chemicals, etc can damage belts	– Tensioning – Vibrations – Endless belts can't be repaired – Extreme temp. ranges, high moisture, oil, chemicals, etc can damage belts	– Noise – Require lubrication – Can elongate due to wear – Limited flexibility – Usually limited to lower-speed applications

Product Name	Spur Gears	Helical Gears	Bevel Gears	Gear Racks	Worm Gears
Usage, Picture					
Efficiency	94–98%	94–98%	93–99%	98–99%	30–90%
Gear Axis	Parallel	Parallel and Intersecting Axis	Intersecting Axis	Non-Intersecting and Non-Parallel Axis	Non-Intersecting and Non-Parallel Axis
Advantages	– Highly reliable, simplest in design and easiest to manufacture – Offer constant velocity ratio and are more efficient than helical gear of same size – Spur gear teeth are parallel to its axis and do not produce axial thrust – Used in efficient power transfer and low speed application (robotics application, machine tools etc.)	– Run more smoothly and quietly than spur gears due to angled teeth desiged – Highly durable and are ideal for high-load applications – Load is distributed over several teeth, resulting in less wear – Used in high-speed, high-power mechanical systems like car gear boxes, machine tools, etc.	– This gear makes it possible to change the operating angle – Can be with straight or spiral teeth – Miter gears are a special type of bevel gear designed to operate in pairs with identical numbers of teeth and diametral pitches, and a 1:1 ratio – Transmission, Bevel Gear Differencial, Printing, Material Handeling	– Cheap – Compact – Robust – Easiest way to convert rotation motion into linear motion – Often used in traveling gantries and columns, pick and place robots etc.	– Worm gear drives operate silently and smoothly – Self-locking and occupy less space – Have high velocity ratio – Used for reducing speed and increasing torque (gear reduction boxes)
Disadvantages	– Gear teeth experience a large amount of stress – Cannot transfer power between non-parallel shafts – Compared to other gears, generate more noise at high speeds	– More expensive than spur gears – Mashed helical gears create axial trust that need adequate support (like trust bearings) – Lower efficiency due to axial trust generating more heat between sliding teeth	– One wheel of bevel gear is designed to work with its complementary wheel and no other – Must be precisely mounted – The shafts' bearings must be capable of supporting significant forces – Noisy at the higher speeds	– Inherent friction causes constant wear and part replacment after certin time	– Worm gear materials are expensive – Worm drives have high power losses – They produce a lot of heat

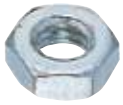
Tapered Washers – Square

Nuts

#BLBN
Nuts – Right-Hand Thread (Box)

#BKNT
Nuts – Right-Hand Thread (Box)



#ANN
Hex Nuts

#SNTR
Compact Nuts (Pack)

#NT
Tall Nuts

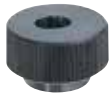
#NTFL
Configurable Length Hex Nuts

#UNUT
U-Nuts (Pack)

#HLN
Double Locking Nuts

#FNT
Domed (Acorn) Nuts

#FRNT
Knurled Thumb Nuts



#QCN
Quick-Lock Nuts – Thumb

#RNLB
Cylindrical Nuts with Hex Socket

#RBNT
Cylindrical Nuts

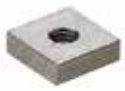
#FRNU
Flanged Nuts

#CRNT
Knurled Thumb Nuts with Side Holes

#NTS
T-Nuts

#ZTN
Tapered Nuts – Square

#NSQ
Rectangular Nuts with Threaded Hole



#FKT
Square Washers & Nuts with One Clearance Hole

#FK2T
Rectangular Washers & Nuts with Two Clearance Holes

Machine Keys

#KED ★
Selectable Length Keys

#KEDF
Configurable Length Keys

#KEDZ
With Counterbores

#KEDY
With Tapped Counterbores

#KEDW
With Counterbores & Tapped Holes

#KEDM
With Tapped Hole

#KETS
Machine Keys – Stainless Steel

#KTH
Tapered Machine Keys with Gib Head

Screw Plugs

#MSW
Screw Plugs – Standard

Dowel, Spring & Stepped Pins

#MS ★
Oversized – One End Chamfered, One End with Radius

#MSCM
Oversized – Both Ends Chamfered

#MSV
Oversized – High Precision

#MSTP
Undersized – Both Ends Chamfered

#THS
Oversized – Pull-out with Thru Hole

#MST
Oversized – Pull-out with Air Vent

#MTT
Oversized – Tapered

#MSH ★
Undersized – One End Chamfered, One End with Radius

#MSHH
Undersized – Both Ends Chamfered

#MSGB
Undersized – General Purpose

#MSHT
Undersized – Pull-Out

#MSTG
Undersized – Pull-Out with Air Vent (g6)

#MSTH
Undersized – Pull-Out with Air Vent (h7)

#KNHN
Dowel Removal Jigs

#MSY
Dual Fit – One End Oversized, One End Undersized

#MSYT
Dual Fit – Pull-Out

#MSFW
Stepped Dowel Pins

#MSIP
Insulating Dowel Pins

#MSIJ
Resin Dowel Pins

#SSPR
Spring Pins

Cotter Pins

#JNPN
Hairpin Cotter Pins

#NPN
Cotter (Split) Pins

Retaining Rings

#STWN
Retaining Rings – External, C-Type

#NETW
Retaining Rings – External, E-Type

#RTWN
Retaining Rings – Internal, C-Type

NEW

#RTWP
Retaining Ring Pliers

#BSTW
Retaining Rings – C-Type, External (Box)

#BNET
Retaining Rings – C-Type, External (Box)

Inserts

#HLSS
Thread Inserts

#HLSX
Taps for Thread Inserts

#HLTP
Thread Insert Installation Tool

#HLTB
Thread Insert Tang Breaking Tool

#HLTN
Thread Insert Removal Tool

#TLTS
Thread Inserts – Tangless

#TLTK
Taps for Tangless Inserts

#TLTN
Tangless Inserts Installation – Removal Tools

#ENT
Self-Tapping Inserts – Slotted

#ENTP
Self-Tapping Inserts Installation Tool

#BHLT
Thread Insert (Box)

#BTLT
Thread Insert (Box)

Wires / Chains / Metal Fittings / Small Work Pieces

NEW

#CWAB
Fastening Wire-Loop – Dia. Configurable

#SCHS
Loss-Prevention Stainless Steel Chain

#BALL
Loss-Prevention Ball Chains

#CHSP
Loss-Prevention Chain

Grease Fittings

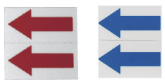
#GPA
Grease Fittings – Straight

#GPB
Grease Fittings – 67.5 degree

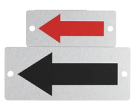
#GPC
Grease Fittings – 90 degree

Stickers / Plates

#HH
Temperature Recording Labels



#ARWS
Arrow Stickers – Straight



#APWS
Arrow Plates – Straight

#AWRB
Arrow Stickers – Curved

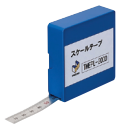
#KHPT
Open/Closed Sign Plates

#LRM
Warning/Danger Triangular Stickers

#LRDM
Caution/Warning/Danger Mark Stickers

#CHC
Caution/Warning/Danger Stickers

Parts / Small Work Pieces



#TMEL
Scale Tape

#MEAA
Angle Scale – 180 Deg.

#MEAN
Angle Scale with Adhesive Tape

#SMTP
Bubble Level – Flanged Mounting

#SMH
Bubble Level – Press-Fit

#MES
Scale Plates

#PPL
Pointing Plates

NEW
#DW
Retaining Washers

NEW
#PWW
Crimp Brackets (Package)

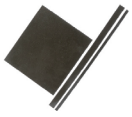
#WWN
Crimping Tools

#UKC
Attachment for Anchoring Wire

Magnets

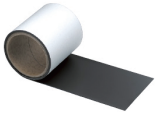
★
#HXN
Magnets – Cylindrical

#MGLF
Magnets – Rectangular, Neodymium



#HXP
Magnets – Flexible, Super Strong

#HXRS
Magnets – Flexible, Rectangular Sheets



#HXR
Magnets – Flexible, Roll

#HXUK
Magnets – Oval Holder with Mounting Holders, Counterbored, Tapped

#HXU
Magnets with Holder – Tapped

★
#HX
Magnets with Holder – Tapped, Short

#MGN
Magnets with Holder – Tapped, Long

#MGR
Magnets with Holder – Knurled

#HYM
Magnets with Holder – V Groove

#HXBY
Magnets – Threaded

#HXBB
Screw Stoppers with Magnet

#MGE
Electromagnet Holders

#MGEC
Rectifier for Electromagnet

12	Dowel Pins Straight Type	MS4-10	8
13	Socket Head Cap Screws	SCBS4-16	8
14	Socket Head Cap Screws	SCBS6-20	8

Application Overview

Purpose

- Secure and release lengthy workpieces without causing deformation.

Points for Use

- Cylinder employing automatic mechanism
- Workpiece is transferred and release to operation.

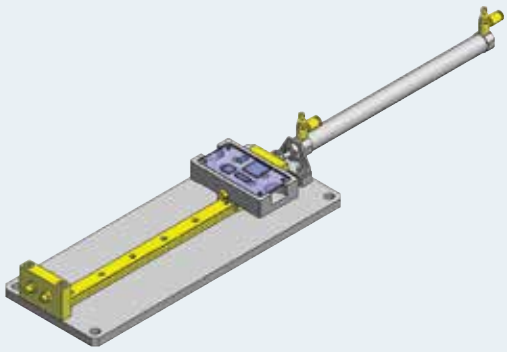
Target Workpiece

- Outer Dimensions: Ø10 x 275
- Material: POM
- Weight: 30 g

IDEA NOTE

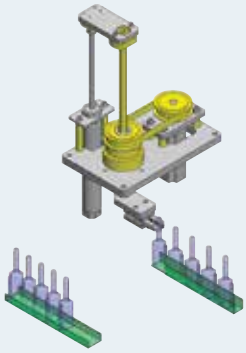
#IN35 Cylinder Linear Motion Mechanism

Table slide with stroke end adjustment



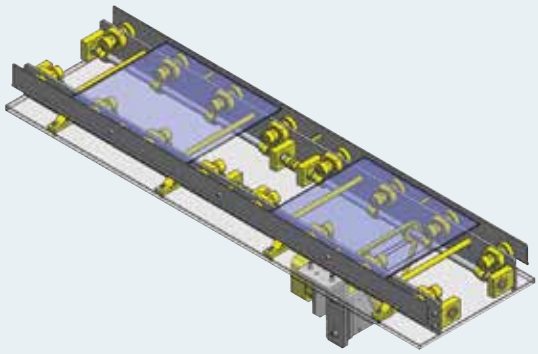
#IN32 Pick and Place Mechanism with Ball Spline

Compact design utilizing ball spline



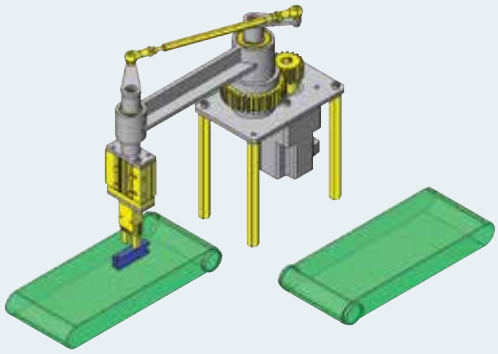
#IN40 Non-Contact Drive Transfer Mechanism

A non-contact drive transfer mechanism with TM Magnets



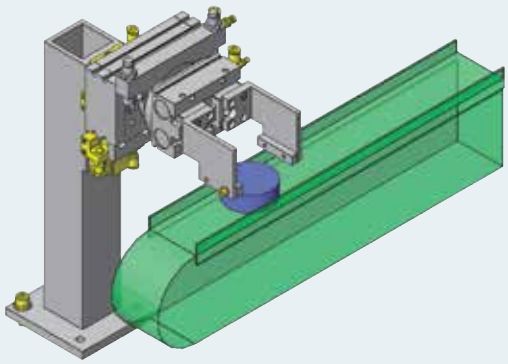
#IN75 Workpiece Inversion and Transfer Mechanism

Motor and gear system rotates the arm and gripper simultaneously



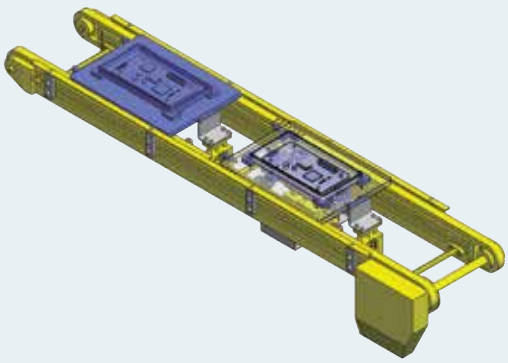
#IN20 Rotating Gripper Unit

Using MISUMI standard components eliminates the need for custom parts



#IN38 Positioning and Stopper Mechanism for Pallet Transfer

Stopper + lifter positioning mechanism



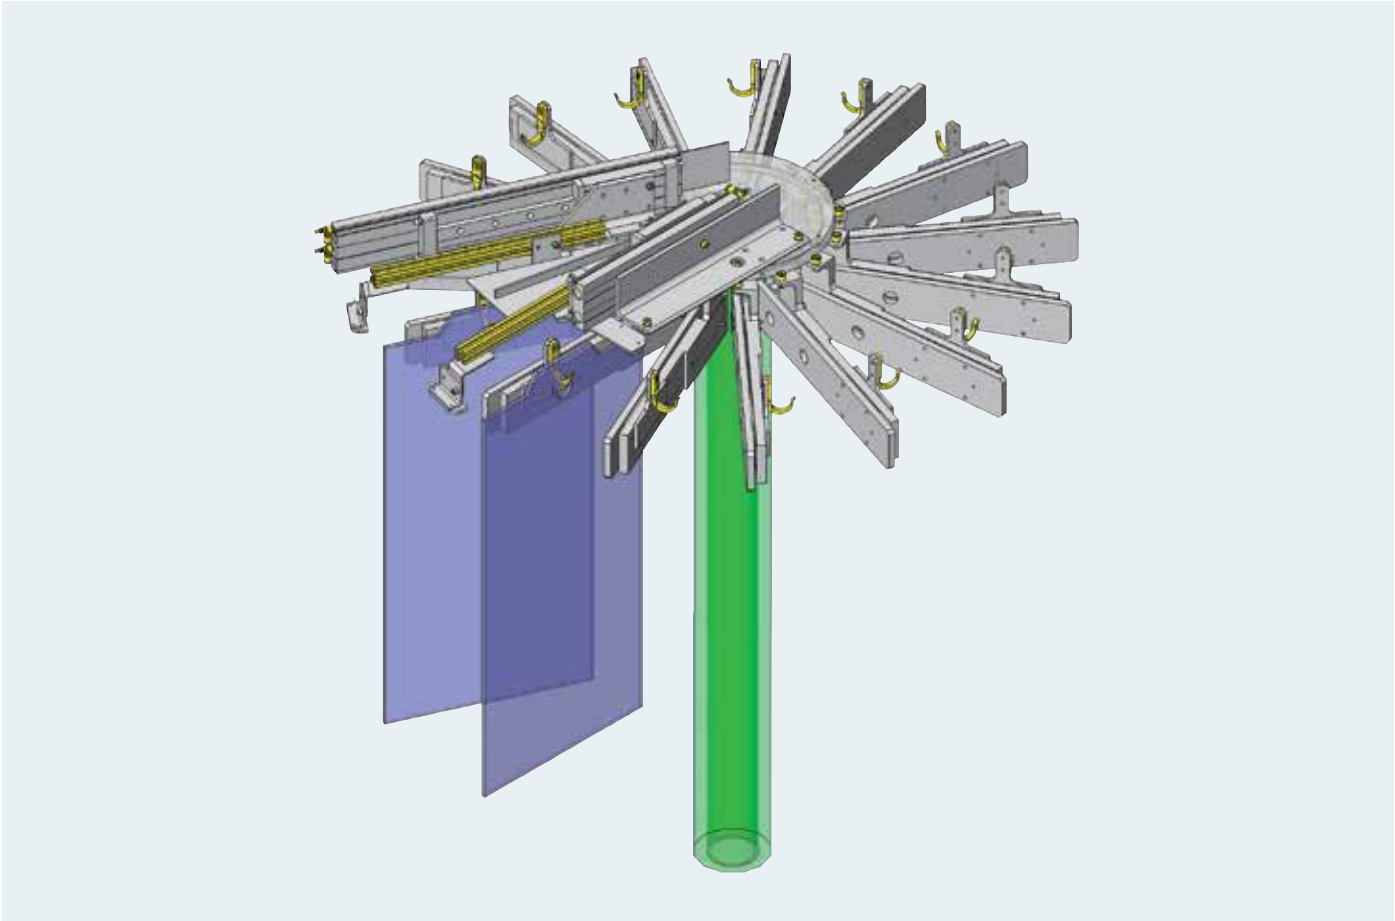
Application Example

Feed / Discharge

#IN169

Workpiece Input / Discharge

Mechanism that moves radially aligned workpieces to necessary positions one by one



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Aluminum Frames	NFS5-2020-330	2
2	Pre-Assembly Insertion Short Nuts	HNTT5-5	12
3	Cam Followers – Flat Type, No Seal	CFR5-13	30
4	Hooks	HKKJ	15
5	Flow Rate Control Valves	SPSNL6-M5	4
6	Socket Head Cap Screws	SCBZ6-16	19
7	Socket Head Cap Screws	SCBZ5-10	7

9	Socket Head Cap Screws	SCBZ3-8	8
10	Socket Head Cap Screws	SCBZ5-20	30
11	Cross Recessed Flat Head Machine Screws	SFBJ5-10	30
12	Socket Head Cap Screws	SCBZ5-15	4
13	Socket Head Cap Screws	SCBZ4-12	60

Application Overview

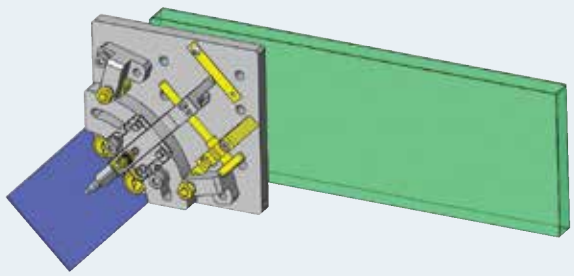
Purpose

- Device in which workpieces are stored radially with their positions retained by the cam followers and retaining rails and necessary workpieces are moved in rotation to the supply and discharge position for input and output of the workpieces. Structure in which the retaining rails are disconnected at the input/output position and the cam followers come off the retaining rails to move to the movable rails.

IDEA NOTE

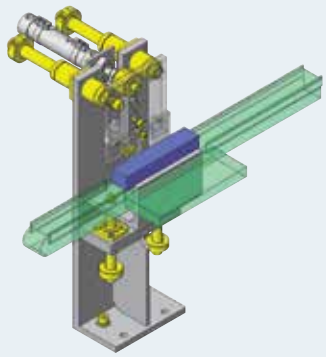
#IN50 Adjustment of Angle at Offset Center Point

Adjustment of angle at offset center point



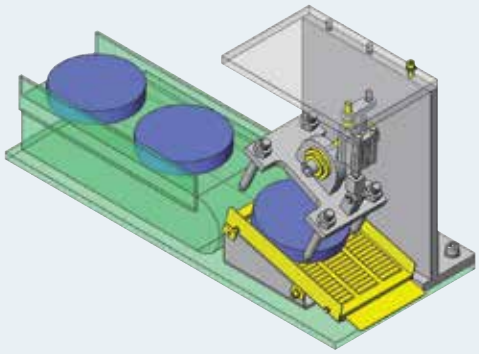
#IN23 Workpiece Escaping Unit

Double acting cylinder mechanism with cam follower the cylinder performs two actions by using a cam



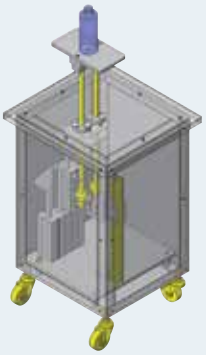
#IN67 Escapement Unit

Double acting cylinder using an oscillating mechanism



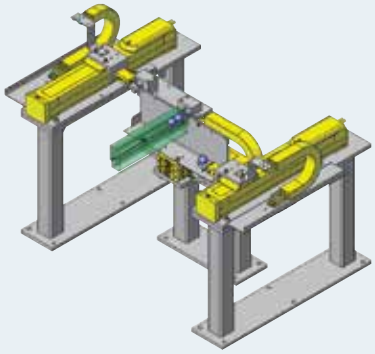
#IN142 Stroke Lift Device

Lift device utilizing two cylinders



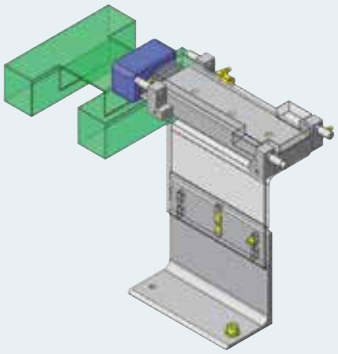
#IN128 Sorting Mechanism

Reduce cycle time by utilizing right / left sorting mechanism



#IN144 Workpiece Pusher

A buffering mechanism that utilizes a flat spring



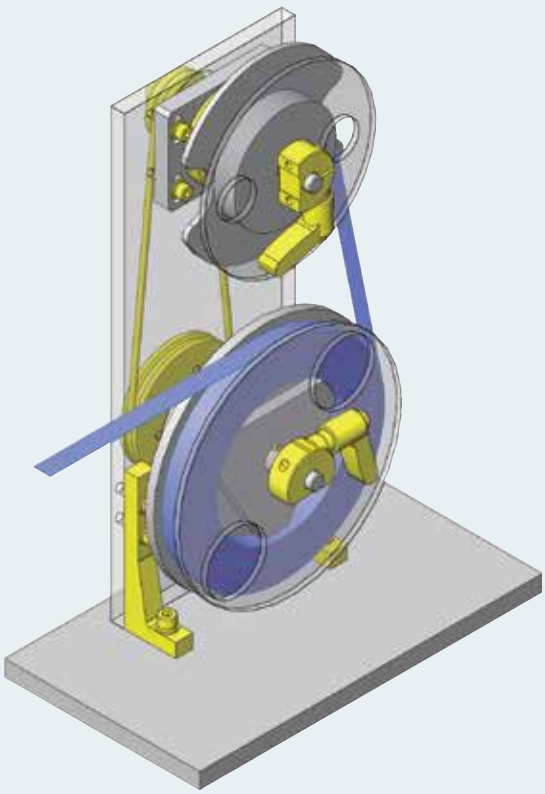
Application Example

Ejection / Collection

#IN12

Tape Spool-Up Fixture

A mechanism that automatically spools the paper backing from doubly sided tape



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Pulleys for Round Belts – Setscrew	MBRA60-1.5-P10	1
2	Pulleys for Round Belts – Setscrew	MBRDA30-1.5-P8	1

4	One-Way Clutches	BHFL10	1
5	Deep Groove Ball Bearings	SB6900ZZ	1
6	Bearings with Housings	SBARB628ZZ-25	1
7	Shaft Collars – Set Screw with 2 Holes	SSCTW12	1
8	Shaft Collars	SSCDKJM8-B	2
9	Economy Gussets (Precision Casting)	RQDW30-80	2
10	Parallel Keys	KESS4-8	1
11	Parallel Keys	KESS3-8	1
12	Metal Washers (Standard Class)	WSSS14-10-8	1
13	Metal Washers (Standard Class)	WSSS14-6-1	1
14	Metal Washers (Standard Class)	WSSS14-5-1	1
		WSSS12-8-6	1

Application Overview

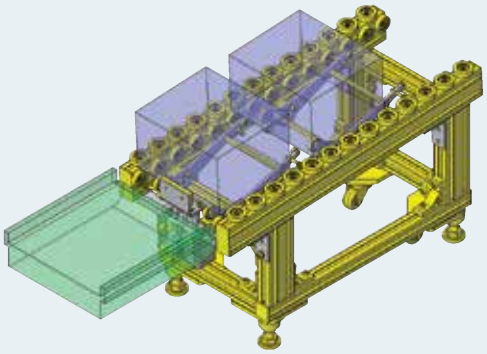
Purpose

- A machine that automatically spools the paper backing from double sided tape as the tape is dispensed.
- As the tape is pulled out, the lower pulley holds the tape in place while the upper pulley spools the paper backing.
- Through the use of a belt, the upper and lower pulleys are coupled together to absorb rotational speed differences.

IDEA NOTE

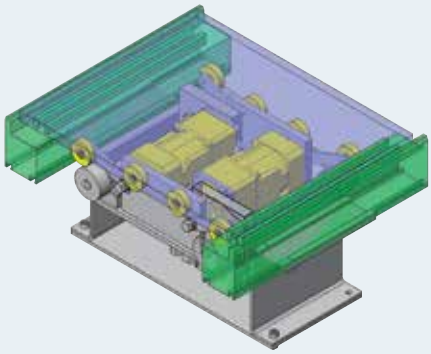
#IN68 Conveyor with Escapement

Escapement mechanism for gravity conveyor



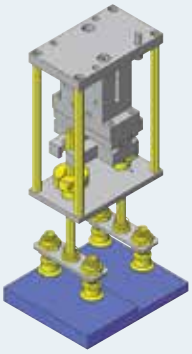
#IN143 Branching / Merging Mechanism

Provides branching and merging of workpieces in various work stations



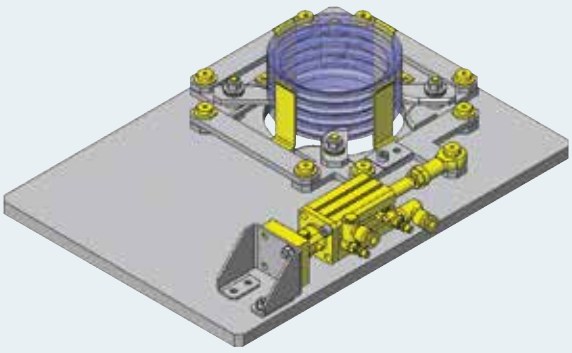
#IN175 Workpiece Gripper Unit with Suction Cups

Fixing the sliding suction cup at hands



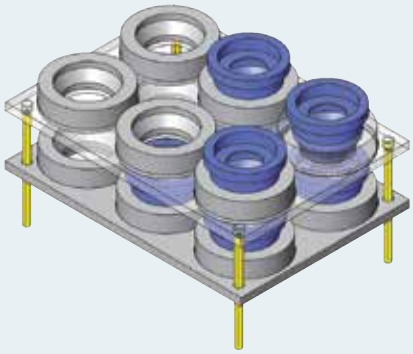
#IN161 Workpiece Separation / Feed Mechanism

Separation and unloading of circular workpieces with a single cylinder



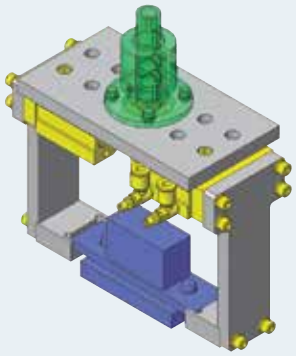
#IN7 Stacking Fixture

Stackable workpiece holding fixture



#IN81 No Load Gripping Mechanism

No load gripping with a cylinder



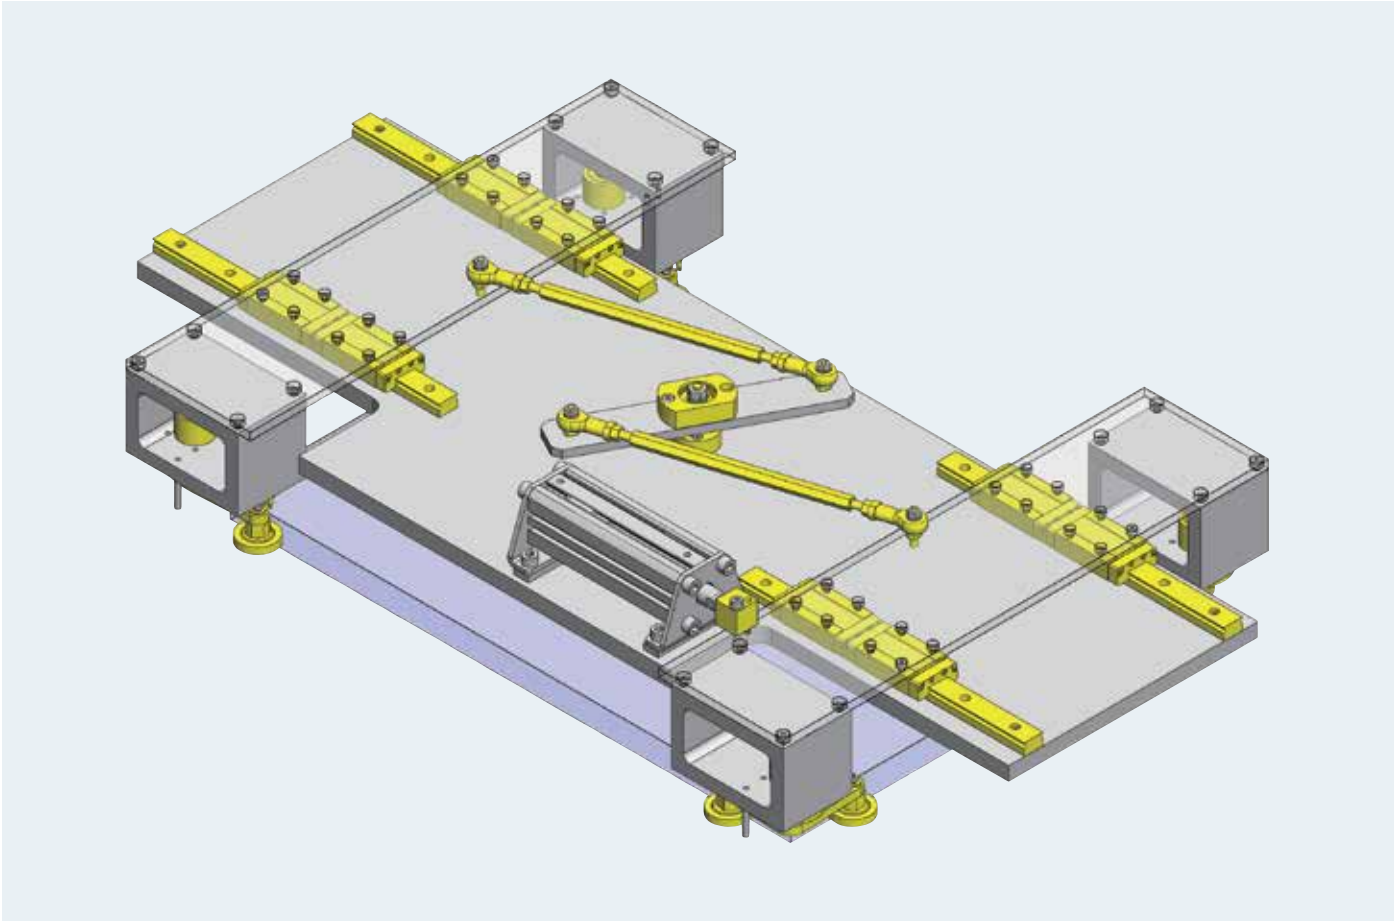
Application Example

Positioning / Clamp

#IN76

Pallet Centering Mechanism

4 direction simultaneous clamping with a cylinder and a linkage mechanism



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Miniature Linear Guides – Long Blocks	SSELB16-230	4
2	Cantilever Shafts – Flanged	PFXFC8-24-F6-M6	1

7	Cantilever Shafts	PFXAC5-5-F7-MA4	4
8	Bearings with Housings	BARC626ZZ-35	4
9	Cantilever Shafts	PFXMB6-10-F35-T1-MA3	4
10	Collars (Standard/Precision Class)	NCLM6-10-23	4
11	Metal Washers (Standard Class)	WSSM10-3-1	24
12	Links – Angled, 3 Hole	LKBM6-L50-S50-Q90-H...	4
13	Cantilever Shafts	PFXMB6-10-F5-T1-MA3	8
14	Silicon Rubber/Urethane Molded Bearings	UMBB6-28	8
		FJMXL6-1.0	1

Application Overview

Purpose

- (Objective) One cylinder clamps in four directions.
- (Operation) Pallets transferred on a roller conveyor are centered at working position.

Points for Use

- Production line where the pallets are detected by photomicrosensor and stopped on the conveyor.
- Pallet evacuation mechanism is not needed.

Target Workpiece

- Shape: Pallet
- Size (mm): 450 W x 300 D x 20 H
- Weight: 5 kg

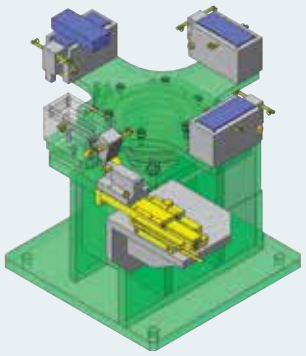
IDEA NOTE

#IN152 XY Floating Mechanism

Simplified floating mechanism

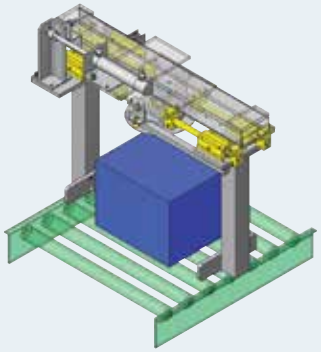
#IN139 Workpiece Clamp Station

Clamp mechanisms operated by pneumatic linear actuator



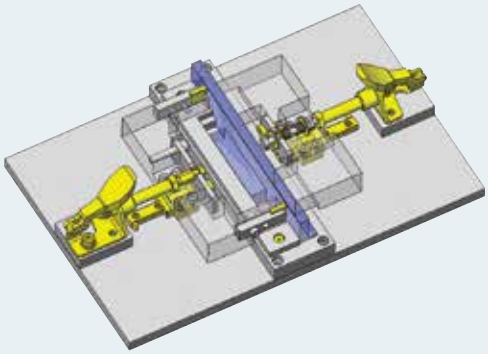
#IN27 Centering Unit

Align scattered workpieces on a conveyor



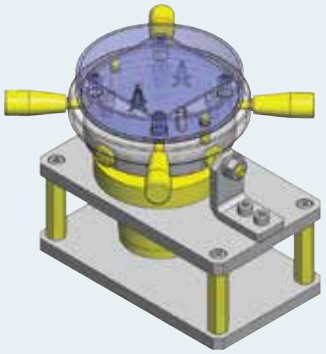
#IN5 Soldering Fixture

Soldering fixture that can accommodate different size workpieces



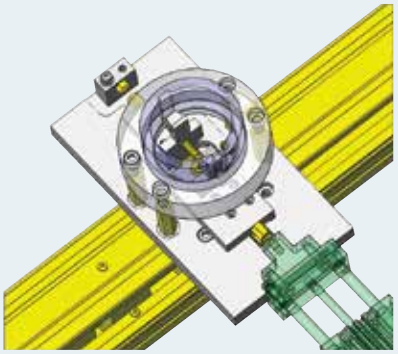
#IN42 Manually Indexed Rotary Table

Ball Buttons are used to prevent wear on the outside of the housing



#IN79 Linkage Operated Gripping Mechanism

Linkage operated grip mechanism controlled and released by an external force



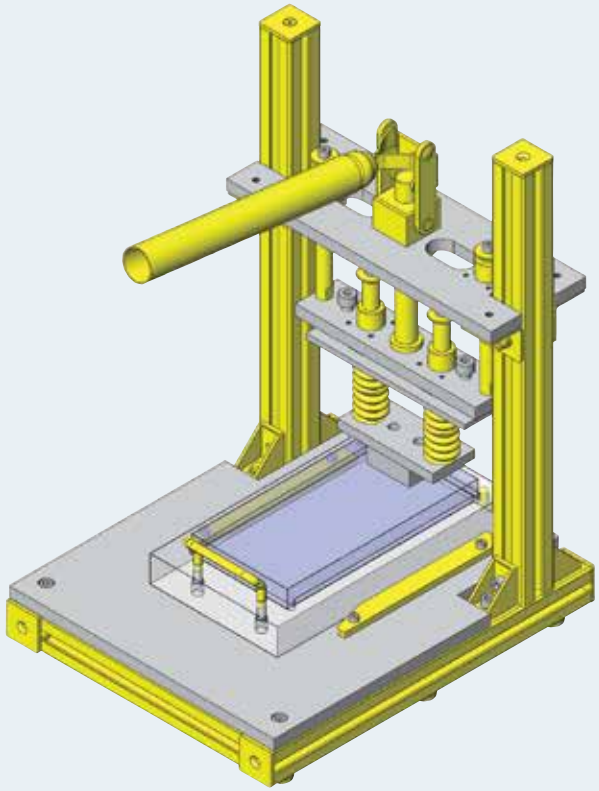
Application Example

Assembly / Machining

#IN10

Film Press Bonding Device

Height adjustable with Aluminum Extrusion frame



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Toggle Clamps (Free Attachable)	MC02-3	1
2	Aluminum Frames	NEFS6-3030-190	2

14	Stainless Steel Pipe Frames	PFSUS28-200	1
15	Handles – Small Diameter, Offset	UHFNSC60	1
		MSC8-20	2

Application Overview

Purpose

- A manual mechanism for pressure bonding of film to aluminum case.

Points for Use

- Use guide to position the workpiece into correct position.
- Mechanism for pressure bonding is operated with toggle clamp.

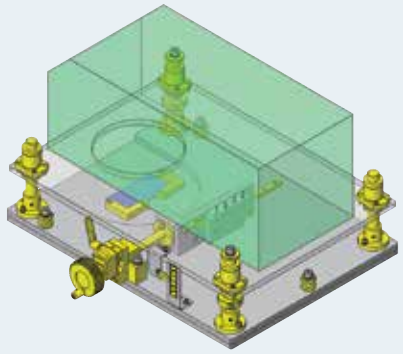
Target Workpiece

- Aluminum case
- External Dimensions (mm): 90 W x 180 D x 16 H
- Weight: 700 g
- Thin film
- Dimensions (mm): 35 W x 30 D x 0.5 t

IDEA NOTE

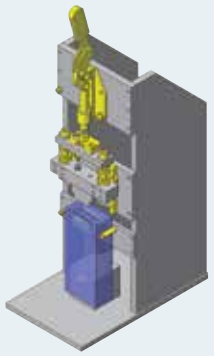
#IN111 Z-Axis Elevating Mechanism

An elevating mechanism with slant mounted Linear Guide



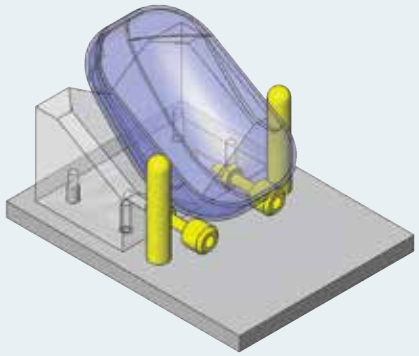
#IN2 Film Press Bonding Device

Press bonding mechanism with uniform load adjustment mechanism



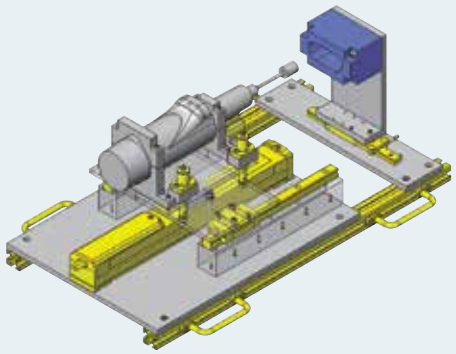
#IN9 Fixture with Adjustable Positioning

Workpiece angle can be adjusted by Stopper Bolts



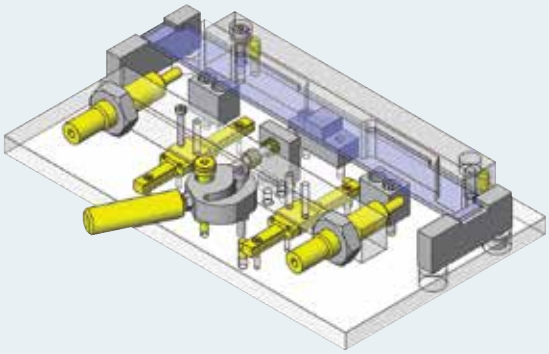
#IN24 Semi-Automatic Grinding Device

A Single Axis Robot with vertical movement controlled by hand



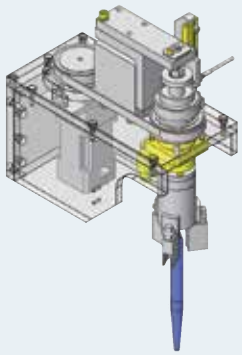
#IN8 PC Board Fixture

Retention using eccentric cam



#IN176 Revolving Pneumatic Gripper

Pneumatic gripper capable of transmitting revolution



Application Example

Inspection / Measurement

#IN149

Film Press Bonding Device

Height adjustable with Aluminum Extrusion frame

14	Motors with Electromagnetic Brake	PACMB90-W40-V100	1
		PACMGX90-10	1

Application Overview

Purpose

- To feed cylinder-shaped workpieces at a fixed rate

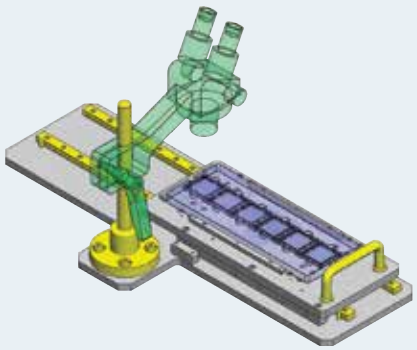
Target Workpiece

- Shape: aluminum cylinder part
- Size: Ø20 x 200 mm
- Weight: 0.15 kg

IDEA NOTE

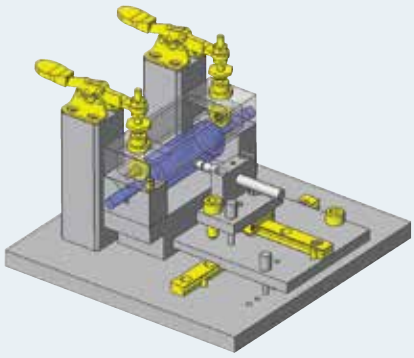
#IN44 Slide Positioning Mechanism

Slide positioning mechanism indexed with a Ball Plunger



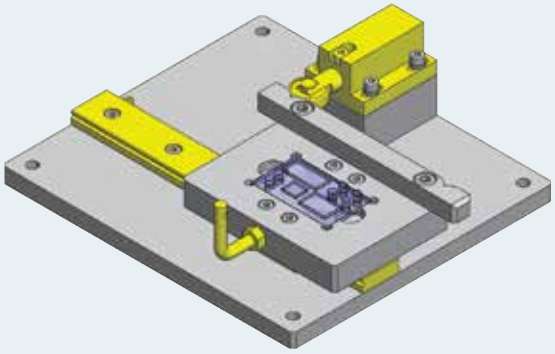
#IN3 Roller Runout Inspection

The workpiece is held with V Blocks and Urethane Molded Bearings, enabling highly accurate runout inspection



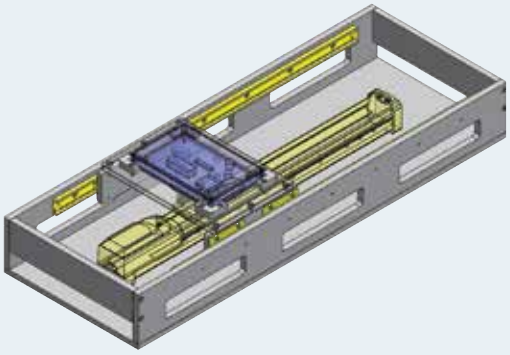
#IN43 Simple Slide Positioning

Simple indexing slide mechanism using Roller plunger



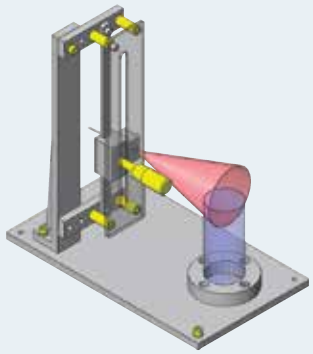
#IN36 Multi-Point Position Slide Unit

A multi-position slider with a Single Axis Robot



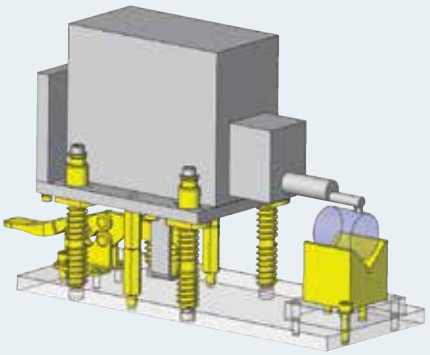
#IN147 Laser Height Adjustment Mechanism

Simplified height adjustment



#IN15 Surface Inspection Fixture

Surface inspection fixture with Toggle Clamp for quick setup



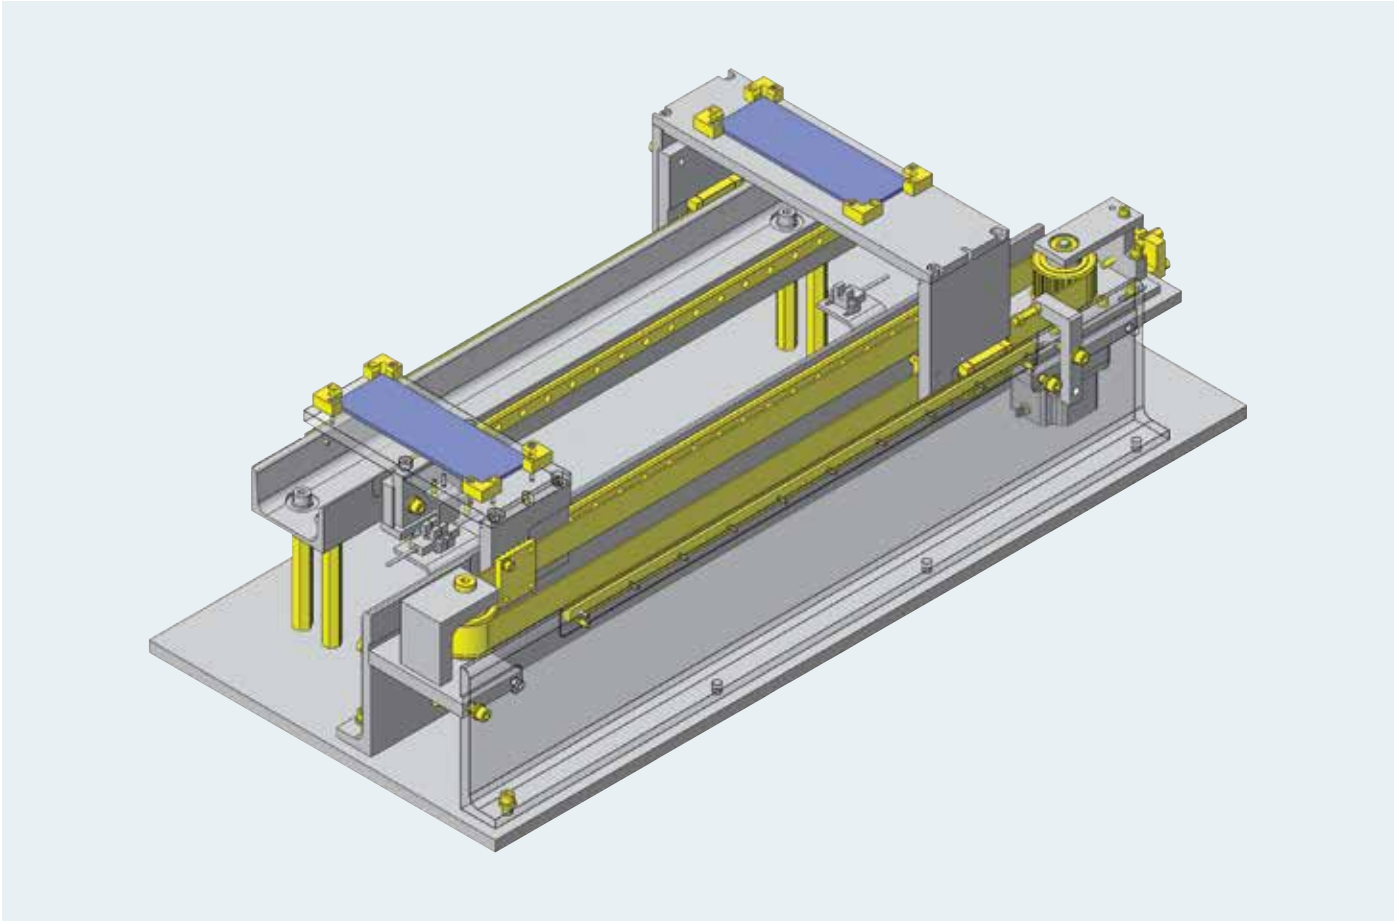
Application Example

Drive

#IN140

Shuttle Transfer Mechanism

Two workpieces are transferred simultaneously through a belt mechanism



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty

13	Adjusting Bolts – Hexagon Type, Standard	AJSTM5-35	1
14	Dowel Pins	MSC4-12	6
		WGLBC-20-10-10	8

Application Overview

Purpose

- A single driving mechanism to simultaneously transfer two workpieces in opposite directions.

Points for Use

- Automatic mechanism in which a single driving mechanism drives two tables

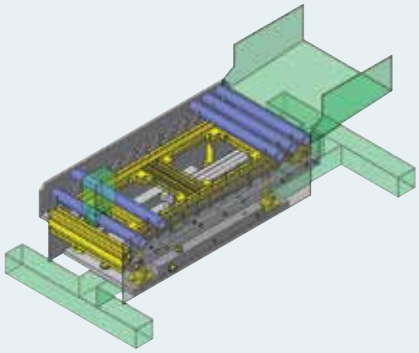
Target Workpiece

- Workpiece: printed circuit board
- Outer Dimensions (mm): 150 W x 50 D x 3 H
- Workpiece Weight: 50 g

IDEA NOTE

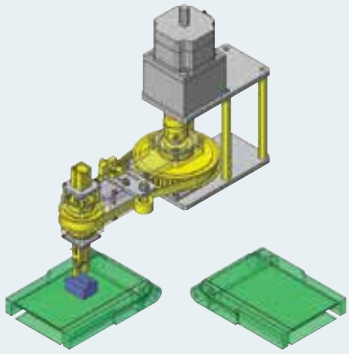
#IN80 Feeding Mechanism for Round Bars

Transfer workpieces with a saw tooth mechanism



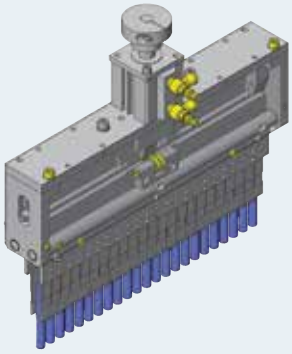
#IN127 Workpiece Inversion and Transfer Mechanism

Rotate and transfer but workpiece orientation in direction of travel remains the same



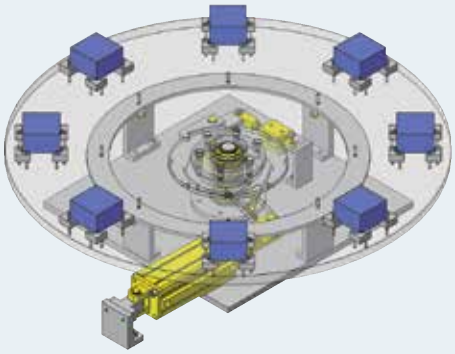
#IN167 Collective Chuck

Flat spring structure at the tips of the chuck to prevent stress on workpieces



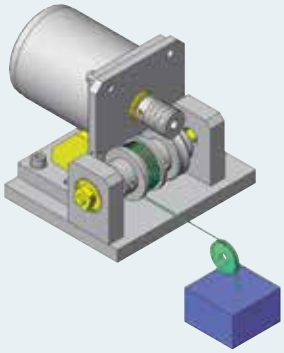
#IN148 Intermittent Rotation Mechanism

Cylinder-driven index table



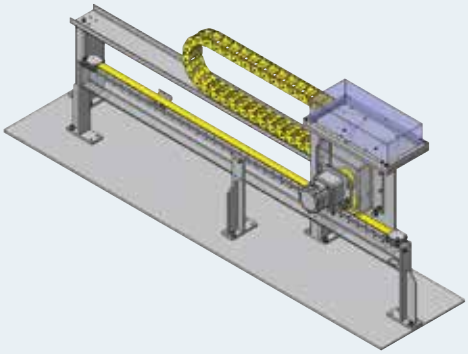
#IN181 Reduces the Thrust Load of a Small-Size Motor Shaft

Reducing the thrust load without using a coupling



#IN84 Long Stroke Slide Mechanism

Belt driven self propelled mechanism



Application Example

Workpiece Treatment

#IN25

Rotating Fixture Mechanism

Slow rotation of fixture is controlled by rotary damper

14	Aluminum Extrusions	HFS6-3030-700	8
		HBLFSN6	60

Application Overview

Purpose

- A fixture to assemble a heavy cover on a workpiece with screws on multiple surfaces.

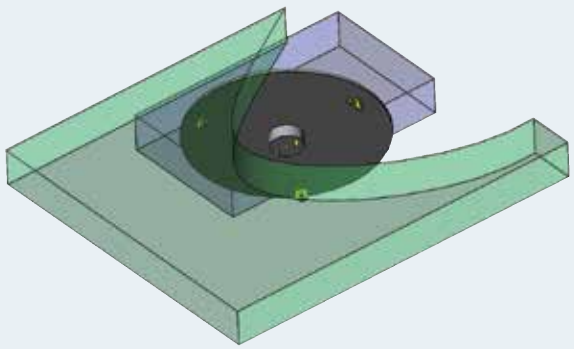
Operation Procedure

1. Set up the cover and the main body (workpiece) on the fixture.
2. Temporarily fix the main body on the fixture by hand-tightening bolts.
3. Turn the fixture 90º and assemble the cover and the main body with the screws (top, bottom, front, and back).
4. Turn the fixture back to the original position and remove the bolts.

IDEA NOTE

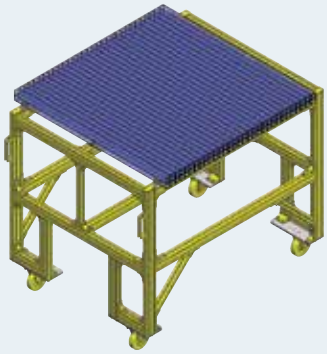
#IN183 Removable Turntable

Bottom view of removable turntable



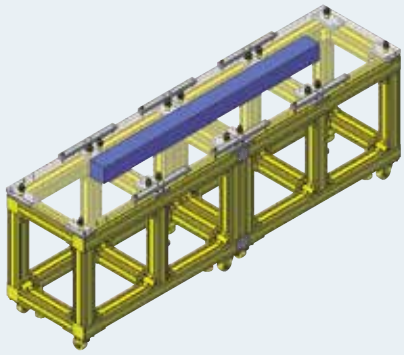
#IN55 Material Transport Cart

Transport cart made of aluminum extrusion



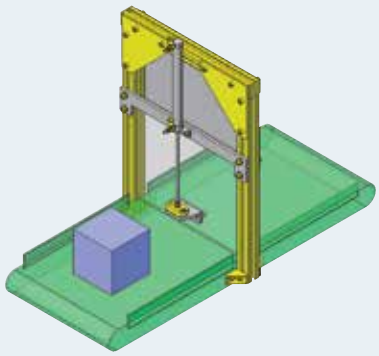
#IN63 Long Length Precision Table

Long table constructed from configurable components



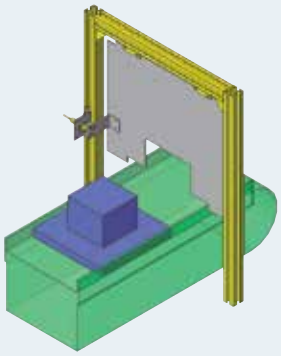
#IN93 Guided Shutter Mechanism

Aluminum Extrusion slots are utilized as shutter guides



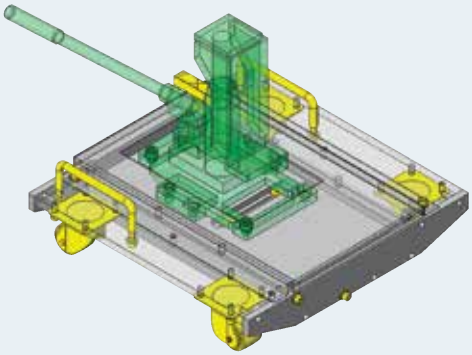
#IN94 Detection Curtain

Curtain style detection



#IN106 Adjustable Low Profile Cart

XY adjustment using flat rollers

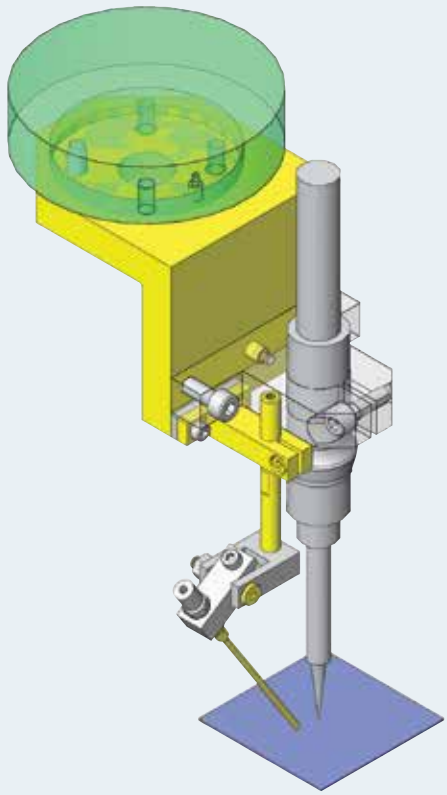


Application Example
Workpiece Treatment

#IN95

Soldering Hand with Air Purge

Simple nozzle and distance adjustments



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Angles – Extruded	LRA12-A75-B60-L65	1
2	Shaft Supports – T-Shaped, Slit Type	SHSTS6-25	1
3	Precision Linear Shafts	PSSFGZ6-55-M3-N3-SC...	1
4	Air Blow Nozzles	ABNZL5-2.0-65	1
5	Bearing Shaft Screws	BGPSL4-7-L22-F7	1
6	Dowel Pins Straight Type	MS4-10	1
7	Dowel Pins Straight Type	MS5-10	1

Application Overview

Purpose

- Air purge nozzle removes post-solder oxidation material from soldering iron tip.

Points for Use

- The air purge should be done away from the work piece. A suction component should also be used to prevent secondary contamination.
- Adjust the nozzle position for most effective air purging of oxidation.

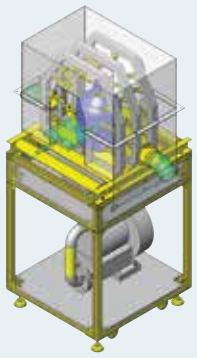
Target Workpiece

- Electronic PC board
- Dimensions: 50 W x 50 H x 1 t
- Weight: 0.1kg

IDEA NOTE

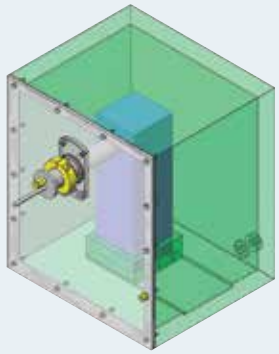
#IN122 Air Blow Device

An air blow device that blows air from all directions



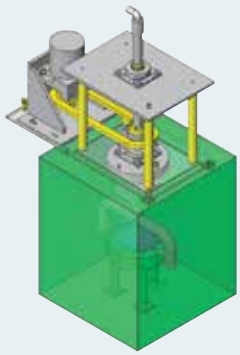
#IN204 Camera Adjustment Device with Air Blower

Camera with air blower



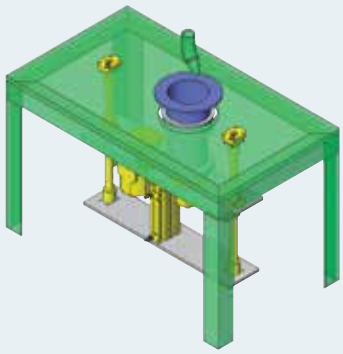
#IN233 Rotary Part Cleaning Unit

Cleans workpiece exterior with a rotary arm nozzle



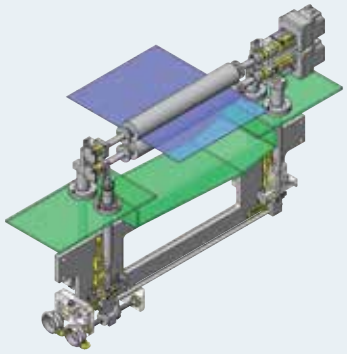
#IN260 Rotation / Lift Device

Rotation and lift device



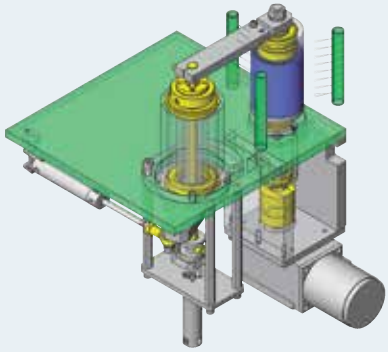
#IN225 Brush Cleaning

Glass circuit board cleaning device



#IN229 Swing Clamp

Clamps and rotates workpiece in a swing motion



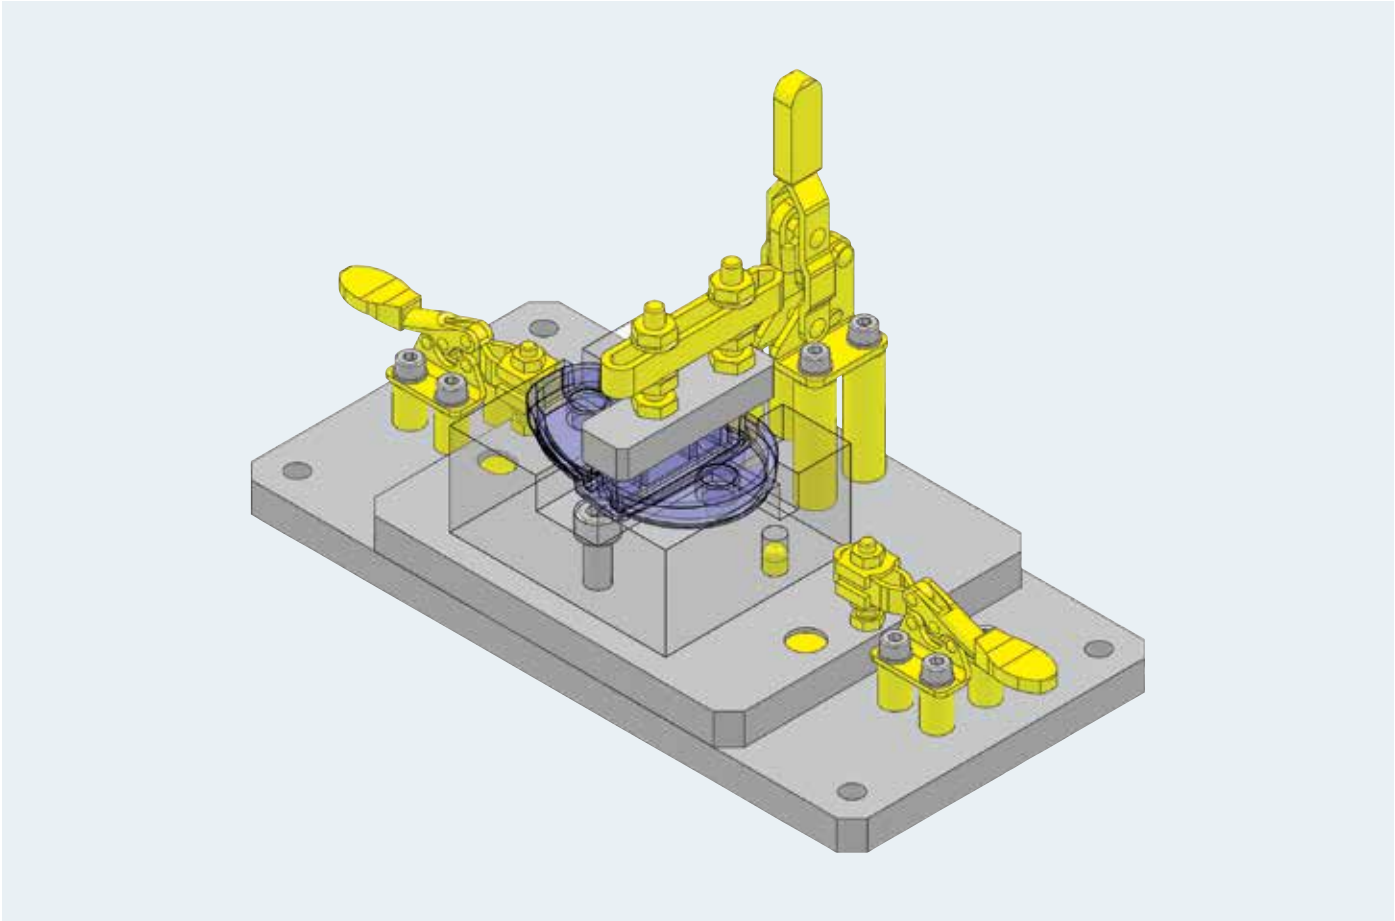
Application Example

Positioning / Clamping

#IN48

Workpiece Clamp Fixture

Choosing clamps based on setup frequency



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Toggle Clamps – Horizontal Handle	MC01-2	2
2	Collars (Standard/Precision Class)	NCLB4-8-12	8
3	Dowel Pins Straight Type	MS10-20	2
4	Dowel Pins Straight Type	MS8-20	2
5	Locating Pins – Straight, Sphere	SLPSQAG6-L15	4
6	Toggel Clamps	MC04-1L	2
7	Collars – Standard/Precision Class	NCLB4-10-35	8
8	Miniature Clamp Levers – Threaded	CLDMC6-12-B	2

Application Overview

Purpose

- Fixture for press-fitting insertion nuts into various workpieces

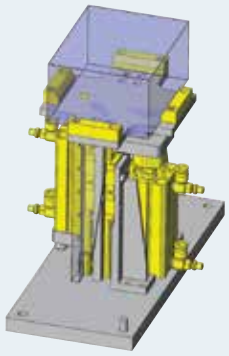
Target Workpiece

- Plastic cases
- Approximate Workpiece Size (mm): 45 W x 62 D x 10 H

IDEA NOTE

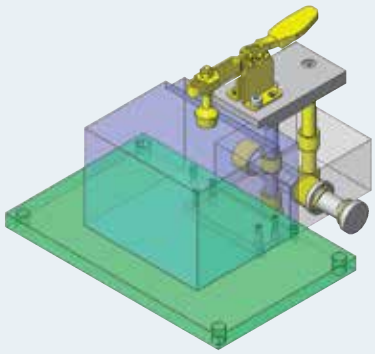
#IN172 Space-Saving and Long-Stroke Device

Speeding up with long stroke



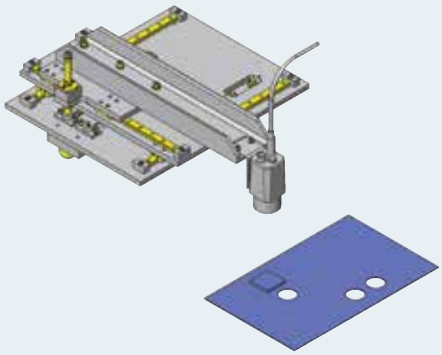
#IN137 Adjustable Height Clamping Mechanism

Simple switching by manual operation



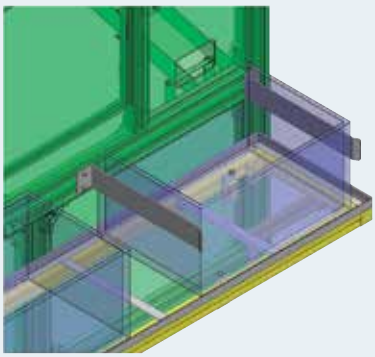
#IN275 Mult-Position Setup Device

Setup by means of shift lever groove



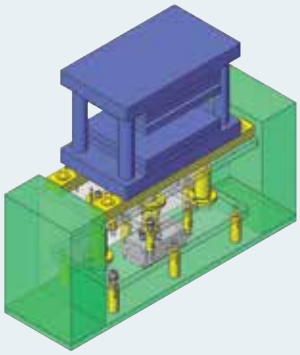
#IN51 Tray In-Position Confirmation Process

Workpiece detection with diagonally placed detection units



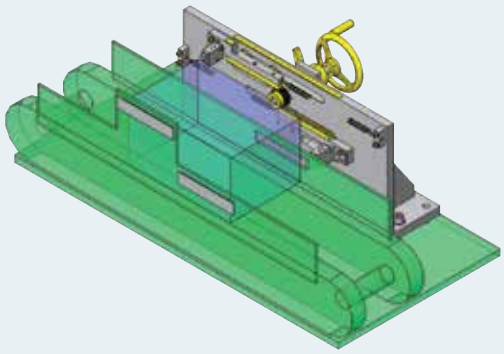
#IN108 Linear Movement Mechanism

Slowly strokes for a short distance



#IN301 Width Change Mechanism

Right and left movement synchronization using center of the workpiece as the reference



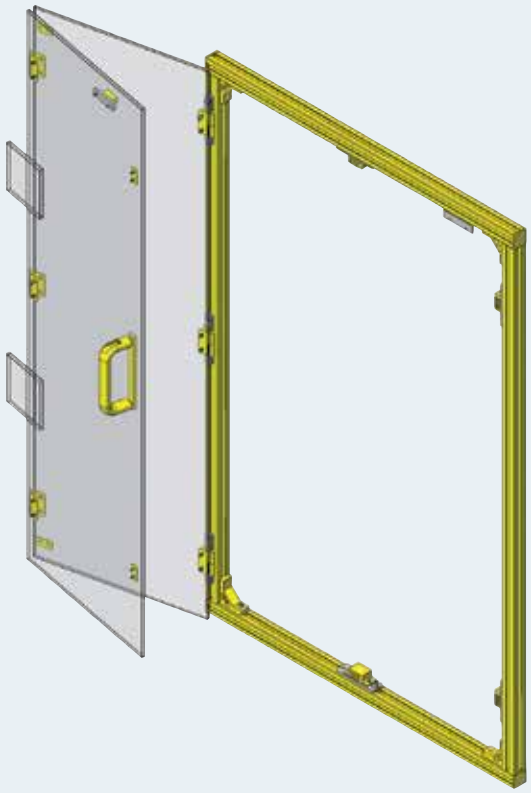
Application Example

Human and Workpiece Safety

#IN102

Aluminium Folding Door with Sensor

Simple construction and space saving with a folding door



MISUMI Part List

No.	Part Name	MISUMI Part Number	Qty
1	Aluminum Frames	NEFS6-3030-1090	2
2	Aluminum Frames	NEFS6-3030-734	2
3	Frame End Caps – 6 Series	HFC6-3030-S	4
4	Brackets	HBKTS6	4
5	Pre-Assembly Insertion Short Nuts	HNTT6-6	24
6	Magnet Catches with Ferrite Magnet	MGCE1	4
7	Door Limit Switches	BCWS1	1
8	Detachable Hinges (Stainless Steel)	SHHPSLC6-2	3
9	Handles – Oval, Standard Lengths	UADS132	1
10	Rectangular Washers & Nuts	FK2TS16-A150-P132	1
11	Cross Recessed Low Flat Head Screws	TSARA3-6	8
12	Flat Head Cap Screws (Pack)	SFB4-8	6
13	Flat Head Cap Screws (Pack)	SFB4-15	18
14	Thread Inserts	HLTS3-6	10
15	Detachable Hinges (Stainless Steel)	SHHPSRC6-2	3

Application Overview

Purpose

- A transparent door with a open / closed confirmation function

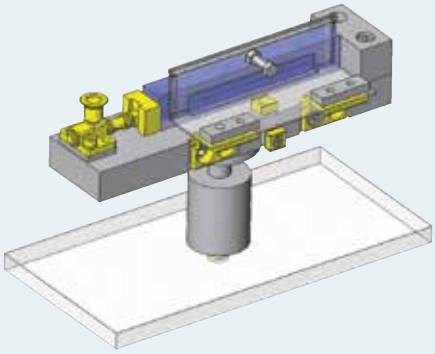
Points for Use

- A door limit switch is used to indicate if the door is open or closed.
- The door rotates 180° at the base and 180° at the center hinges. A magnetic catch is used to hold the door closed.

IDEA NOTE

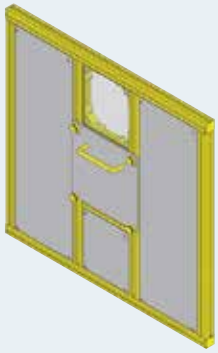
#IN4 Free Angle Soldering Fixture

Easy one-touch workpiece holding mechanism



#IN54 Removable Window Panel

Removable window panel with knobs and keyholes

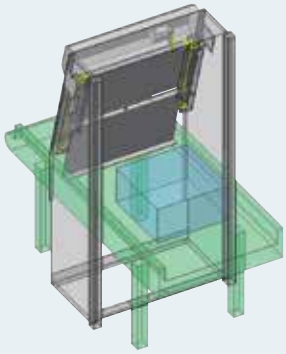


#IN87 Aluminum Extrusion Frame Door

Simple open / close detection structure

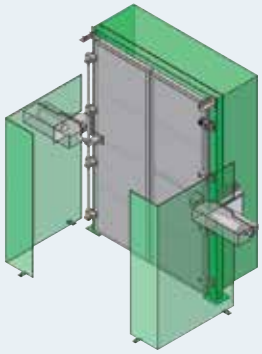
#IN85 Shutter Mechanism

A shutter utilizing pulley / belt + bevel gear



#IN91 Automated Door

A cylinder powered mechanism used to open a door



#IN104 Automated Ventilation Mechanism

Rapid Cooling Mechanism

SI (International System of Units)

1. International System of Units (SI) and Usage

1-1. Scope of Application This standard specifies how to use the International System of Units(SI)and other international unitary systems, as well as units used in correlation with units from international systems, and other units which may be used.

1-2. Terms and Definitions Terminology used in this specification and definitions thereof are as follows.

(1) International System of Units(SI) Coherent system of units adopted and recommended by the International Committee on Weights and Measures. It contains base units and supplementary units, units derived from them and their integral exponents to the 10th power.

(2) SI Unit Generic term used to describe base units, supplementary units or derived units of the International System of Units(SI).

(3) 1 Base Unit Those units are given in **Table 1**.

(4) 2 Supplementary Units Those supplementary units are given in **Table 2**.

Table 1. Base Units

Base Quantity	Unit	Symbol	Definition
Length	Meter	m	A meter is the length of the path traveled by light in a vacuum during a time interval of $\frac{1}{299\ 792\ 458}$ of a second.
Mass	Kilogram	kg	A kilogram is a unit of mass(neither weight nor force), it is equal to the mass of the international prototype of the kilogram.
Time	Second	s	A second is the duration of 9 192 631 770 periods of radiation corresponding to the transition between the two hyperfine levels of the ground state of the cesium 133 atom.
Current	Ampere	A	An ampere is that constant current which, if maintained in two straight parallel conductors of infinite length, of negligible circular cross-section, and placed 1 meter apart in a vacuum, would produce between these conductors a force equal to 2×10^{-7} Newton per meter of length.
Thermodynamic Temperature	Kelvin	K	Kelvin, a unit of thermodynamic temperature, is the fraction $\frac{1}{273.16}$ of the thermodynamic temperature of the triple point of water.
Amount of Substance	Mole	mol	A mole is the amount of substance of a system that contains as many elementary particles(1) or aggregation of elementary particles as there are atoms in 0.012 kilogram of carbon 12 and when the mole is used, the elementary particles must be specified.
Luminance Intensity	Candela	cd	A candela is the luminous intensity, in a given direction, of a source that emits monochromatic radiation of frequency 540×10^{12} hertz and that has a radiant intensity in that direction of $\frac{1}{683}$ watt per steradian.

Note(1) The elementary particles here must be atoms, molecules, ions, electrons or other particles.

Table 2. Supplementary Units

Base Quantity	Unit	Symbol	Definition
Plane Angle	Radian	rad	A radian is the plane angle between two radii of a circle that cuts off an arc on the circumference equal in length to the radius.
Solid Angle	Steradian	sr	A steradian is the solid angle which, having its vertex in the center of a sphere, cuts off an area of the surface of the sphere equal to that of a square with sides equal in length to the radius of the sphere.

(5)3 Derived Units The supplementary units algebraically expressed using mathematical symbols such as plus, minus, etc. The SI derived units with special names and symbols are given in Table 3.

Examples of SI Derived Units Expressed in Terms of Base Units

Base Quantity	Base Quantity	
	Name	Symbol
Area	Square	m^2
Volume	Cubic Meter	m^3
Velocity	Meter/Second	m/s
Acceleration	Meter/Second×2	m/s^2
Wave Number	Every Meter	m^{-1}
Density	Kilogram Every Cubic Meter	kg/m^3
Current Density	Ampere Every Square Meter	A/m^2
Magnetic Field Strength	Ampere Every Meter	A/m
Concentration (of Substance)	Mole Every Cubic Meter	mol/m^3
Specific Volume	Cubic Meter Every Kilogram	m^3/kg
Luminance	Candela Every Square Meter	cd/m^2

Table 3. SI Derived Units with Special Names and Symbols

Base Quantity	Base Quantity		Expression in Terms of Base Units or Supplementary Units, Supplementary Units or Other SI Units
	Name	Symbol	
Frequency	Hertz	Hz	1 Hz =1 s^{-1}
Force	Newton	N	1 N =1 $kg{\cdot}m/s^2$
Pressure, Stress	Pascal	Pa	1 Pa =1 N/m^2
Energy, Work, Heat Quantity	Joule	J	1 J =1 N·m
Work Rate, Process Rate, Power, Electric Power	Watt	W	1 W =1 J/s
Electric Charge, Quantity of Electricity	Coulomb	C	1 C =1 A·s
Electric Potential, Potential Difference, Voltage, Electromotive Force	Volts	V	1 V =1 J/C
Electrostatic Capacity, Capacitance	Farad	F	1 F =1 C/V
Electric Resistance	Ohm	Ω	1 Ω =1 V/A
Conductance	Siemens	S	1 S =1 Ω^{-1}
Magnetic Flux	Weber	Wb	1 Wb =1 V·s
Magnetic Flux Density	Tesla	T	1 T =1 Wb/m^2
Inductance	Henry	H	1 H =1 Wb/A
Celsius Temperature	Degree Celsius or Degree	℃	1 t℃ =(t+273.15)k
Luminous Flux	Lumen	lm	1 lm =1 cd·sr
Illuminance	Lux	lx	1 lx =1 lm/m^2
Radioactivity	Becquerel	Bq	1 Bq =1 s^{-1}
Absorbed Dose	Gray	Gy	1 Gy =1 J/kg
Dose Equivalent	Sievert	Sv	1 Sv =1 J/kg

1-3. Multiples of 10 of SI Units

(1)Prefix The multiples and the names and symbols of prefixes to express integer multiples of 10 of SI Units are shown in Table 4.

Table 4. Prefix

Multiples of Unit	Prefix		Multiples of Unit	Prefix		Multiples of Unit	Prefix	
	Name	Symbol		Name	Symbol		Name	Symbol
10^{18}	Exsa	E	10^{2}	Hecto	h	10^{-9}	Nano	n
10^{15}	Peta	P	10^{1}	Deca	da	10^{-12}	Pico	p
10^{12}	Tera	T	10^{-1}	Deci	d	10^{-15}	Femto	f
10^{9}	Giga	G	10^{-2}	Centi	c	10^{-18}	Atto	a
10^{6}	Mega	M	10^{-3}	Milli	m			
10^{3}	Kilo	k	10^{-6}	Micro	μ			

2. Conversion Tables for SI and Conventional Units

(The units enclosed by thick lines are the SI units.)

	N	lbf	kgf
Force	1	0.22481	$1.019\,72\times10^{-1}$
	4.448	1	0.4536
	9.806 65	2.205	1

Quantifiers, Unit Symbols, Chemical Symbols and Symbols of Elements Calculation of Cubic Volume and Weight / Physical Properties of Materials

■ Greek Symbols

Uppercase	Lowercase	Pronunciation	Conventional Usage
A	α	alpha	Angle, Coefficient
B	β	beta	Angle, Coefficient
Γ	γ	gamma	Angle, Weight Per Unit Area, Relationship (Uppercase)
Δ	δ	delta	Small Change, Density, Displacement
E	ε	epsilon	Small Amount, Distortion
Z	ζ	zeta	Variable
H	η	eta	Variable
Θ	θ	theta	Angle, Temperature, Time
I	ι	iota	
K	κ	kappa	Radius of Gyration
Λ	λ	lambda	Wavelength, Characteristic Value
M	μ	mu	Friction Coefficient 10^{-6}(Micro)
N	ν	nu	Frequency
Ξ	ξ	xi	Variable
O	ο	omicron	
Π	π	pi	Circle Ratio (3.14159...) Angle Symbol of Product (Uppercase)
P	ρ	rho	Radius, Density
Σ	σ	sigma	Stress, Standard Deviation Summation (Uppercase)
T	τ	tau	Time Constant, Time, Torque
Υ	υ	upsilon	
Φ	φ, φ	phi	Angle, Function, Diameter
X	χ	chi	
Ψ	ψ	psi	Angle, Function
Ω	ω	omega	Angular Verocity=2πf Ohm:Unit of Electric Resistance (Uppercase)

Reference unless otherwise specified, lowercase letters are the norm.

■ Characteristics of Materials

Material	Specific Gravity	Thermal Expansion Coefficient	Young's Modulus
		×10^{-6}/°C	{Kgf/mm^2}

52	Tellurium	T			

Reference This table is based on Appendix A (Names and Symbols of Elements)of ISO 31/8-1980 (Amounts and Units of Physical Chemistry and Molecular Physics) and Appendix C (Names and Symbols of Radionuclides) of ISO 31/9-1980 (Amounts and Units of Atomic Physics and Nuclear Physics).

■ How to Calculate the Volume

Solid	Volume V
Turncated Cylinder 	$V=\frac{\pi}{4}d^2h$ $=\frac{\pi}{4}d^2\left(\frac{h_1+h_2}{2}\right)$
Pyramid 	$V=\frac{h}{3}A=\frac{h}{6}arn$ A=Area of Base r=Radius of inscribed circle a=Length of a side of a regular polygon n=Number of the sides of a regular polygon
Spherical Crown 	$V=\frac{\pi h^2}{3}(3r-h)$ $=\frac{\pi h}{6}(3a^2+h^2)$ a is the radius.
Ellipsoid 	$V=\frac{4}{3}\pi abc$ In case of spheroid (b=c) $V=\frac{4}{3}\pi ab^2$

Solid	Volume V
Oval Ring 	$V=\frac{\pi^2}{4}d^2\frac{\sqrt{a^2+b^2}}{2}$
Cross Cylinder 	$V=\frac{\pi}{4}d^2(\ell+\ell'-\frac{d}{3})$
Hollow (Cylinder) 	$V=\frac{\pi}{4}h(D^2-d^2)$ $=\pi th(D-t)$ $=\pi th(d+t)$
Turncated Pyramid 	$V=\frac{h}{3}(A+a+\sqrt{Aa})$ A.a=Area of both ends

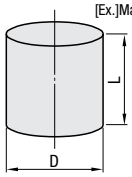
Solid	Volume V
Spherical Segment 	$V=\frac{2}{3}\pi r^2h$ $=2.0944r^2h$
Torus 	$V=2\pi^2Rr^2$ $=19.739Rr^2$ $=\frac{\pi^2}{4}Dd^2$ $=2.4674Dd^2$
Circular Cone 	$V=\frac{\pi}{3}r^2h$ $=1.0472r^2h$
Sphere 	$V=\frac{4}{3}\pi r^3=4.1888r^3$ $=\frac{\pi}{6}d^3=0.5236d^3$

Solid	Volume V
Spherical Belt 	$V=\frac{\pi h}{6}(3a^2+3b^2+h^2)$
Barrel 	When the circumference makes a curve equal to the circular arc, $V=\frac{\pi\ell}{12}(2D^2+d^2)$ When the circumference makes a curve equal to a parabolic line, $V=0.209\ell(2D^2Dd+1/4d^2)$

■ How to Calculate the Weight

Weight W[g]= Volume[cm^3]× Specific Gravity

[Ex.]Material:Mild Steel



D=Ø16 L=50mm the weight is:

The specific gravity of W= $\frac{\pi}{4}D^2\times L\times W$

$=\frac{\pi}{4}\times1.6^2\times5\times7.85$

≈79[g]

Geometric Tolerance Indications

■ Geometric Tolerances and Symbols

Tolerance Types		Symbols	Definition of Tolerance Zones	Illustrated Examples and Interpretations
Form Tolerance	Straightness	—	If the tolerance value is preceded by a Ø symbol, this tolerance zone is the range within a cylinder of diameter t.	If a tolerance frame is connected to a dimension that indicates the diameter of a cylinder, the axis line of the cylinder shall be contained within a cylinder of 0.08mm diameter.
	Flatness	▱	The tolerance zone is the area between two parallel planes separated by distance t.	This surface shall be contained within two parallel planes separated by 0.08mm.
	Circularity	○	The tolerance zone in the subject plane is the area between two concentric circles separated by distance t.	The circumference of arbitrary axis perpendicular cross sections shall be contained between two concentric circles separated by 0.1mm on the same plane.
	Cylindricity	⌭	The tolerance zone is the range contained between two coaxial cylinder surfaces separated by distance t.	The subject surface shall be contained between two coaxial cylinder surfaces separated by 0.1mm.
	Profile of Line	⌒	The tolerance zone is the range contained between the two enveloping lines formed by a circle with diameter t with the center located on the theoretically correct profile curve.	On arbitrary cross-sections parallel to the projection plane, the subject profile shall be contained between the two envelope lines formed by a 0.04mm diameter circle with the center located on the theoretically correct profile curve.
	Profile of Surface	⌓	The tolerance zone is the range contained between the two enveloping surfaces formed by a sphere with diameter t with the center located on the theoretically correct profile surface.	The subject surface shall be contained between the two enveloping surfaces formed by a 0.02mm diameter sphere with the center located on the surface containing the theoretically correct profile.
Orientation Tolerance	Parallelism	//	The tolerance zone is the range contained between two planes parallel to the datum plane separated by distance t.	The surface indicated by the arrow leader shall be contained between two planes parallel to the datum plane A separated by 0.01mm in the direction of the arrow leader.
	Perpendicularity Tolerance	⊥	If the tolerance value is preceded by a Ø symbol, the tolerance zone is the range contained within a cylinder of diameter t perpendicular to the datum plane.	The axis of the cylinder indicated by the arrow leader shall be contained within a 0.01mm cylinder perpendicular to the datum plane A.
	Angularity	∠	The tolerance zone is the range contained between two parallel planes inclined at a specified angle to the datum plane and separated from each other by distance t.	The surface indicated by the arrow leader shall be contained between two parallel planes inclined theoretically exactly by 40 degrees to the datum plane A, and separated by 0.08mm in the direction of the arrow of the leader.
Positional Tolerance	Positional Tolerance	⌖	The tolerance zone is the range contained within a circle or sphere of diameter t with its center located at theoretically true location of the subject point (True Position).	The point indicated by the arrow leader shall be contained within a 0.03mm diameter circle with its center located at the true location 60mm from the datum line A, and 100mm from the datum line B.
	Coaxiality or Concentricity	◎	If the tolerance value is preceded by a Ø symbol, the tolerance zone is the range within a cylinder of diameter t with axis coinciding matching the datum axis line.	The axis of the cylinder indicated by the arrow leader shall be contained within a cylinder of diameter 0.01mm with axis coinciding the datum axis line A.
	Symmetry	⌯	The tolerance zone is the range contained between two parallel planes separated by distance t and located symmetrically with relation to the datum plane.	The central plane indicated by the arrow leader shall be contained between two parallel planes separated by 0.08mm and located symmetrically in relation to the datum plane A.
Runout Tolerance	Runout Tolerance	↗	The tolerance zone is an arbitrary surface perpendicular to the datum axis between two concentric cylinders with centers common with the datum axis, separated in radial direction by the distance t.	The radial run-out of the cylinder surface indicated by the arrow leader shall not exceed 0.1mm on any measuring plane perpendicular to the datum axis line when the cylinder is rotated about the datum axis A-B.
	Total Runout	⌰	The tolerance zone is between two concentric cylinders with centers common with the datum axis, separated in radial direction by distance t.	The total radial runout of the cylinder surface indicated by the arrow leader shall not exceed 0.1mm at any point on the cylinder surface when the cylinder is rotated about the datum axis A-B.

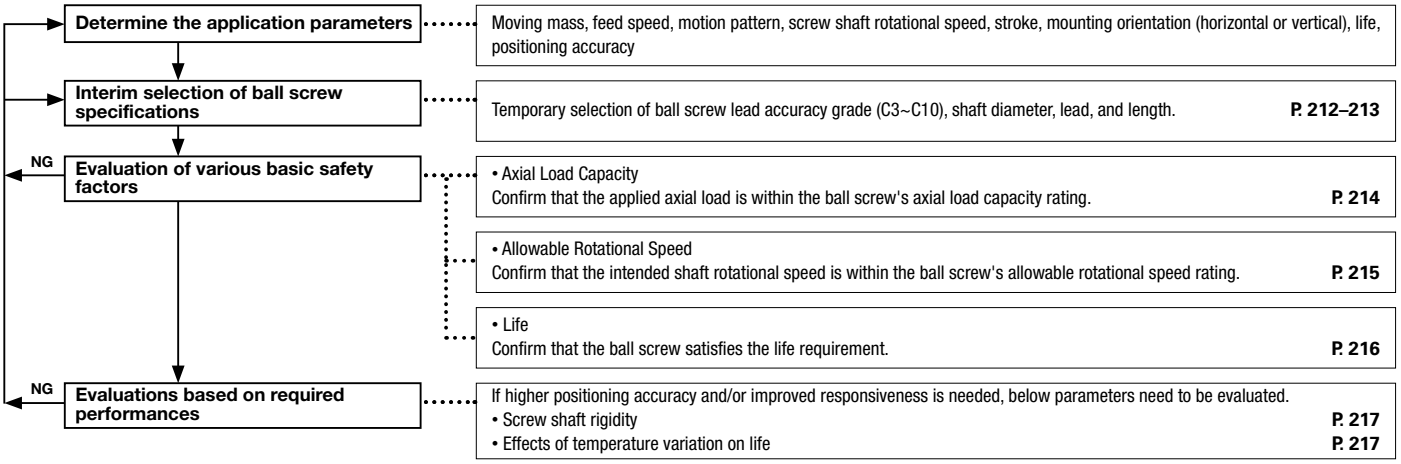
The lines used in the Tolerance Zone definitions mean the following.
Thick solid or broken line: Shape Thin dash-dot line: Center line Thick dash-dot line: Datum Thin alternating long and two short dashed line: Supplementary projection plane or cross section plane
Thin solid or broken line: Tolerance range Thick alternating long and two short dashed line: Projection of shape onto supplementary plane or cross section plane

Technical Data

Selection of Ball Screws 1

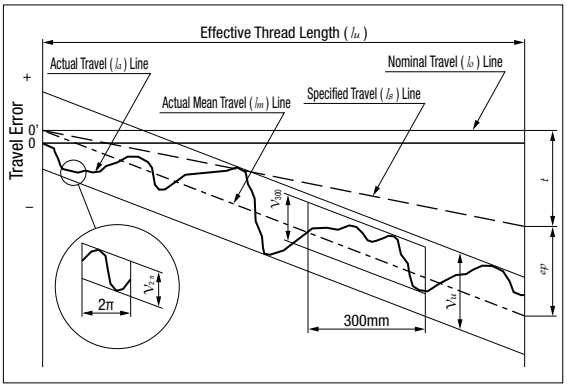
1. Ball Screw Selection Procedure

Basic ball screw selection procedure and required evaluation items are shown below.



2. Ball Screw Lead Accuracy

Ball screw lead accuracy is defined by JIS Standards property parameters (ep, vu, v300, v2π).
Parameter definitions and allowable values are shown below.
In general, a ball screw lead accuracy grade is selected by evaluating if the Actual Mean Travel Error of a candidate is within the allowable positioning error.



Terms	Symbols	Meaning
Actual Mean Travel Error	ep	A value that is Specified Travel subtracted from Actual Mean Travel.
Variation		The maximum difference of the actual travel contained between two lines drawn parallel to the actual mean travel, and is defined by three parameters below.
	v_u	Variation for the effective thread length of screw shaft.
	$v300$	Variation for an arbitrarily taken length of 300mm within the effective thread length of screw shaft.
	$v2\pi$	Variation for an arbitrary one revolution (2πrad) taken within the effective thread length of screw shaft.
Specified Travel	l_s	Axial travel compensated for temperature rise and loading conditions, in relation to the Nominal Travel (Lead).
Specified Travel Target Value	t	A value that is Nominal Travel subtracted from Specified Travel, over the effective thread length. This value is set to compensate for possible screw shaft expansion and contraction due to temperature changes and applied loads. The value is to be determined based on experiments or experiences.
Actual Travel	l_a	Actually measured travel distance
Actual Mean Travel	l_m	A straight line representing the actual travel trend. A straight line obtained by the least-squares method or other approximation methods from the curve representing the actual travel.

■ **Table 1. Positioning Screw (C Class) Actual Mean Travel Error (±ep) and Variation (u) allowances** Unit : μm

Thread Effective Length (mm)		Accuracy Grade			
		C3		C5	
Over	or Less	Actual Mean Travel Error	Variation	Actual Mean Travel Error	Variation
	315	12	8	23	18
315	400	13	10	25	20
400	500	15	10	27	20

Accuracy Grade	Ct7	Ct10
V300	52	210

Actual Mean Travel Error (ep) for Transfer Screws (Ct Class) is calculated as ep=2·Lu/300·V300

3. Axial Clearances of Ball Screws

Axial clearance does not affect positioning accuracy if the feed is unidirectional, but will generate backlash and negatively affect on positioning accuracy if the direction or the axial load is reversed.

Selection Example of Lead Accuracy

<Requirements>
- Ball screw diameter Ø15, lead 20
- Stroke 720mm
- Positioning accuracy ±0.05mm / 720mm

<Selection Details>
Select an appropriate lead accuracy grade based on the application requirements.

(1) Evaluating the screw thread length
Stroke+Nut Length+Margin=720+62+60=842
*The Margin shown above is an overrun buffer, and normally determined as 1.5~2 times the screw lead.
Lead 20 x 1.5 x 2 (both ends)=60

(2) Evaluating the lead accuracy
P. 212 Table 1. is referenced and an Actual Mean Travel Error ±ep for 842mm ball screw thread.
C3 · · · ±0.021mm / 800~1000mm
C5 · · · ±0.040mm / 800~1000mm

(3) Determining the lead accuracy
It can be determined that a C5 grade (±0.040 / 800~1000mm) ball screw can satisfy the required positioning accuracy of ±0.05 / 720mm.

Selection Example of Axial Clearance

<Requirements>
- Ball screw diameter Ø15, lead 5.
- Allowable backlash ±0.01mm

<Selection Details>
From Table 5., it can be determined that C5 grade with 0.005mm or less axial clearance satisfies the allowable backlash amount of 0.01mm for the Ø15 group.

Technical Data

Selection of Ball Screws 2

4. Allowable Axial Load

Allowable Axial Load is a load with a safety margin built-in against a shaft bucking load.

Axial load that applies to a ball screw needs to be less than Allowable Maximum Axial Load.

Allowable Axial Load can be obtained by the following formula.

Additionally, approximate Allowable Axial Load can be obtained from Table 1. Allowable Axial Load Graph.

Allowable Axial Load (P)

$$P = \frac{n\pi^2 EI}{\ell^2}\alpha = m\frac{d^4}{\ell^2}\times 10^4 (N)$$

Where:

P: Allowable Axial Load (N)

ℓ: Distance between Points of Buckling Load (mm)

E: Young's Modulus (2.06×10^5N/mm^2)

I: Min. Geometrical Moment of Inertia of Across Root Thread Area (mm^4)

$$I = \frac{\pi}{64} d^4$$

d : Thread Root Diameter (mm)

n, m : Coefficient Determined by Method of Screw Support

Method of Screw Support	n	m
Support – Support	1	5
Fixed – Support	2	10
Fixed – Fixed	4	19.9
Fixed – Free	0.25	1.2

α : Safety Factor = 0.5

For higher safety, a higher safety factor should be required.

Allowable Axial Load Calculation Example

Find the Allowable Axial Load for Figure 1.

<How to Use>

- Thread shaft diameter Ø15, Lead 5
- Mounting method Fixed – Support
- Distance between Points of Buckling Load ℓ_1 820mm
- Screw Shaft Root Diameter d 12.5

<Calculations>

g=15.1 since the mounting method is Fixed – Supported, the Allowable Rotational Speed (Nc) is,

$$P = m\frac{d^4}{\ell^2}\times10^4 = 10\times\frac{12.5^4}{820^2}\times10^4 = 3630(N)$$

Therefore, the rotational speed will need to be 3024min^{-1} or less.

Table 1.

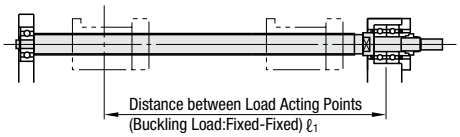

Figure 1. Allowable Axial Load Curve

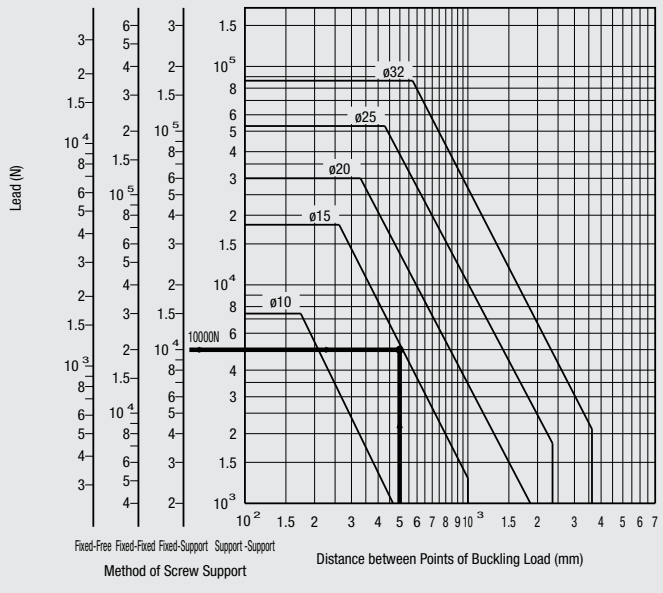

Screw Shaft Dia. Calculation Example

<Requirements>

- Distance between Points of Buckling Load 500mm
- Mounting method Fixed – Support
- the max. axial load 10000N

<Calculations>

(1) Find the intersection between a distance of 500mm between load acting points and the axial load of 10000daN (from the fixed-support graduation). Figure 1.

(2) Read the shaft diameter of the diagonal line nearest to the intersection on the outside. The shaft diameter can be a min. 15 mm.

5. Allowable Rotational Speed

Ball screw rotational speed is determined by required feed speed and the given screw lead, and needs to be less than the Allowable Maximum Rotational Speed.

Ball screw rotational speed is evaluated based on the shaft's critical speed and ball recirculation speed limitation DmN value.

5-1. Critical Speed

Allowable rotational speed is defined as a speed 80% or less of the Critical Speed where the rotational speed coincides with a natural resonant frequency of the screw shaft.

The Allowable Rotational Speed can be obtained by the following formula.

Additionally, approximate Allowable Rotational Speeds can be obtained from Table 2. Allowable Maximum Rotational Speed Graph.

Allowable Rotational Speed (min^{-1})

$$N_c = fa \frac{60\lambda^2}{2\pi\ell^2}\sqrt{\frac{EI\times10^3}{\gamma}} = g\frac{d}{\ell^2}10^7\ (min^{-1})$$

Where:

ℓ: Distance of Supports (mm)

fa: Safety Factor (0.8)

E: Young's Modulus ($2.06\times10^5 N/mm^2$)

I: Min. Geometrical Moment of Inertia of Across Root Thread Area (mm^4)

$$I = \frac{\pi}{64}d^4$$

d: Thread Root Diameter (mm)

γ: Specific Gravity ($7.8\times10^{-6} kg/mm^3$)

A: Root Thread Section Area (mm^2)

$$A = \frac{\pi}{4}d^2$$

g, λ: Coefficient Determined by Method of Screw Support

Method of Screw Support	g	λ
Support – Support	9.7	π
Fixed – Support	15.1	3.927
Fixed – Fixed	21.9	4.73
Fixed – Free	3.4	1.875

Allowable Rotational Speed Calculation Example

Find the Allowable Maximum Rotational Speed for Figure 2.

<How to use>

- Thread shaft diameter ø15, Lead 5
- Mounting method Fixed – Support
- Distance between Points of Buckling Load ℓ_1 790mm

<Calculations>

g=15.1 since the mounting method is Fixed-Supported, the Allowable Rotational Speed (Nc) is,

$$Nc = g\frac{d}{l^2}10^7(min^{-1}) = 15.1\times\frac{12.5}{790^2}\times10^7(min^{-1}) = 3024(min^{-1})$$

Therefore, the rotational speed will need to be $3024min^{-1}$ or less.

Table 2.

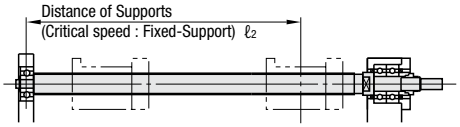

Figure 2. Allowable Rotational Speed Graph

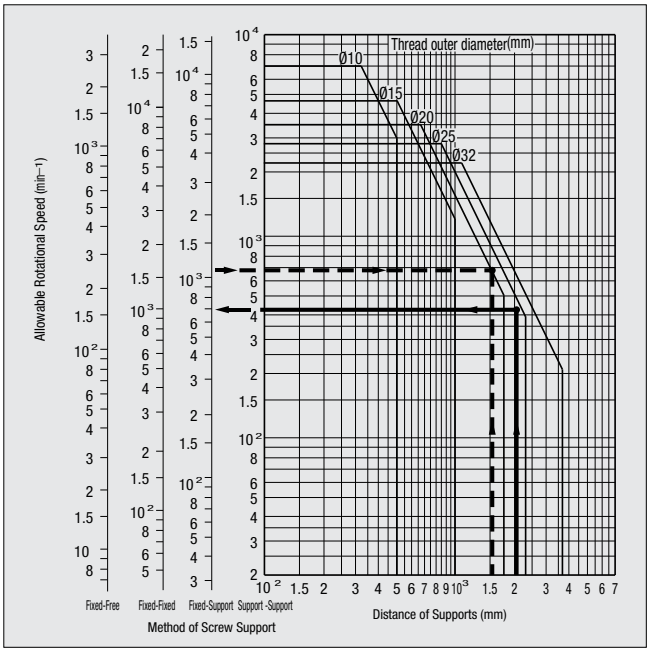


Allowable Rotational Speed Calculation Example

<Requirements>

- Thread outer diameter 20
- Distance of Supports 1500mm
- Mounting method Fixed – Support

<Calculations>

(1) From Table 2., find a intersection of a vertical line from Supported Span Distance 1500mm and Screw Shaft O.D. Ø20 line.

(2) The value $1076min^{-1}$ on the Fixed-Supported scale (Y-Axis) that corresponds to the intersection of (1) above is the Allowable Maximum Speed.

Screw Shaft Dia. Calculation Example

<Requirements>

- Distance of Supports 2000mm
- Maximum Revolution Frequency $1000min^{-1}$
- the max. axial load Fixed – Fixed

<Calculations>

(1) From Table 2., find a intersection of a vertical line from Supported Span Distance 2000mm and a horizontal line from Fixed-Fixed max. speed scale (Y-Axis) at $1000min^{-1}$.

(2) A line that reaches down to the intersection in (1) is the Ø25 ball screw that satisfies the required speed of $1000min^{-1}$.

Allowable Rotational Speed (min^{-1})

$D_mN \leqq 70000$ (Precision Ball Screws)
$D_mN \leqq 50000$ (Rolled Ball Screws)

Where:

D_m: Thread outer diameter(mm)+A Value

N: Maximum Revolution Frequency(min^{-1})

Ball Dia.	A Value
1.5875	0.3
2.3812	0.6
3.175	0.8
4.7625	1.0
6.35	1.8

5-2. DmN Value

The DmN value represents a ball recirculation (orbit) speed limit within a ball nut.

If this vale is exceeded, the recirculation components will be damaged.

Technical Data

Selection of Ball Screws 3

6. Life Span

Ball screw's life is defined as: Total number of rotations, time, or distance where either the ball rolling surfaces or the balls begin to exhibit repetitive stress caused flaking. Ball screw's life can be calculated based on Basic Dynamic Load Rating with the following formula.

6-1. Life Hours (Lh)

$$L_h = \frac{10^6}{60N_m}\left(\frac{C}{P_m f_w}\right)^3 (hrs)$$

Where:
L_h: Life Span Hours (hrs)
C: Basic Dynamic Load Rating (N)
P_m: Mean Axial Load (N)
N_m: Mean Revolution Frequency (min^{-1})
f_w: Work Factor

Impactless Run	f_w = 1.0~1.2
Normal Run	f_w = 1.2~1.5
Run with Impact	f_w = 1.5~2.0

• Basic Dynamic Load Rating: C
Basic Dynamic Load Rating (C) is defined as: An axial load which a group of same ball screws are subjected and 90% of the specimen will reach 1 million rotations (10^6) without experiencing any flaking of the rolling surfaces. See product catalog pages for the Basic Dynamic Load Ratings.

*Setting life span hours longer than what is actually necessary not only requires a larger ball screw, but also increases the price.
In general, the following standards are used for life span hours:

Machine Tools: 20,000hrs	Automatic Control Equipment: 15,000hrs
Industrial Machinery: 10,000hrs	Measuring Instruments: 15,000hrs

*The basic dynamic load rating that satisfies the set life span hours is expressed by the following formula.

$$C = \left(\frac{60L_hN_m}{10^6}\right)^{\frac{1}{3}} P_m f_w (N)$$

Life Calculation Example

<Requirements>

- Ball Screw Model BSS1520(Ø15 Lead 5)
- Mean Axial Load Pm 250N
- Mean Revolution Frequency Nm 2118 (min^{-1})
- Work Factor fw 1.2

<Calculations>

Since Basic Dynamic Load Rating C for BSS1520 is 4400N,

$$L_h = \frac{10^6}{60\times2118}\left(\frac{4400}{250\times1.2}\right)^3 = 24824(hr)$$

Therefore, Life will be 24824 hours.

6-2. Axial Load

Axial loads that apply on the screw shafts will vary depending on applicable motion profile such as acceleration, constant velocity, and deceleration phases. Following formula can be used.

-Axial Load Formula-

Constant Velocity · · · Axial Load (Pb)=μWg
Acceleration · · · Axial Load (Pa)=Wα+μWg
Deceleration · · · Axial Load (Pc)=Wα-μWg

* Omit the "μ" for vertical applications.
μ: Linear bearing friction coefficient (0.02 or Linear Guides)
W: Load Mass N
g: Gravitational Acceleration 9.8m/s^2
α: Acceleration (*)

(*) Acceleration (α)=(Vmax/t)x10^{-3}
Vmax: Rapid Feed Rate mm/s
t: Acceleration/Deceleration Time s

6-3. Formulae for Average Axial Load and Average Rotational Speed

Average Axial Load and Average Rotational Speed are calculated based on proportions of motion profiles. Average Axial Load and Average Rotational Speed for Motion profiles in Table 1. can be calculated with the Formula 2.

Table 1. Motion Profile ($t_1+t_2+t_3$=100%)

Motion Profile	Axial Load	Rotational Speed	Hours Ratio
A	P_1N	N_1min-1	$t_{1\%}$
B	P_2N	N_2min-1	$t_{2\%}$
C	P_3N	N_3min-1	$t_{3\%}$

[Formula 2. Average Axial Load Calculation]

$$P_m = \left(\frac{P_1^3N_1t_1+P_2^3N_2t_2+P_3^3N_3t_3}{N_1t_1+N_2t_2+N_3t_3}\right)^{\frac{1}{3}} (N)$$

$$N_m = \frac{N_1t_1+N_2t_2+N_3t_3}{t_1+t_2+t_3} (min^{-1})$$

For case of a machine tool application, Max. Load (P1) would be for the heaviest cutting cycles, Regular Load (P2) is for the general cutting conditions, and Minimum Load (P3) is for the non-cutting rapid feeds during positioning moves.

Average Axial Load and Average Rotational Seed Calculation Example

<Requirements>

Motion Profile	Axial Load	Rotational Speed	Hours Ratio
A	343N	1500min	29.4%
B	10N	3000min	41.2%
C	324N	1500min	29.4%

<Calculations>

(1) Average Axial Load

$$Pm = \left(\frac{343^3\times1500\times0.294+10^3\times3000\times0.412+324^3\times1500\times0.294}{1500\times0.294+3000\times0.412+1500\times0.294}\right)^{\frac{1}{3}} = 250(N)$$

Therefore, the Average Axial Load Pm will be 250N.

(2) Average Rotational Speed

$$Nm = \frac{1500\times0.294+3000\times0.412+1500\times0.294}{0.294+0.412+0.294} = 2118(min^{-1})$$

Therefore, the Average Rotational Speed Nm will be 2118min.

7. Screw Shaft Mounting Arrangements

Representative ball screw mounting arrangements are shown below.

Mounting Methods	Application Example
	• Typical method • Medium ~ High Speeds • Medium ~ High Accuracy For Support Units, Standard Type BRW / BUR is selected
	• Medium Speeds • High Accuracy • For Support Units, Standard Type BRW is selected
	• Low Speeds • For Short Screw Shafts • Medium Accuracy • For Support Units, Economy Type BRWE is selected

8. Temperature and Life

When ball screws are continuously used at 100°C or higher, or used momentarily at very high temperatures, Basic Dynamic/Static Load Ratings will be reduced according to the temperature rise due to changes in material compositions.

However, there will be no effects up to 100°C. Basic Dynamic Load Rating C" and Basic Static Load Rating Co" at 100°C or higher with the temperature factors ft and ft' can be expressed with the following formula.

$C'' = ftC(N)$
$C_0'' = ft'C_0(N)$

Temperature °C	100 or less	125	150	175	200	225	250	350
ft	1.0	0.95	0.90	0.85	0.75	0.65	0.60	0.50
ft'	1.0	0.93	0.85	0.78	0.65	0.52	0.46	0.35

Normal usage range is -20~80°C. For application in high temperature, use of heat resistant grease as well as heat resistivity of other components should be evaluated.

9. Rigidity

In order to improve accuracies and system response of precision machinery and equipment, feed screw related component rigidity must be evaluated. Rigidity of feed screw system can be expressed with the following formula.

$$K = \frac{P}{\delta} \text{ (N/μm)}$$

Where:
P: Axial Loads Applied on Feed Screw System (daN)
δ: Elastic Deformation of Feed Screw System (μm)
Additionally, the following relationship exists between the feed screw system rigidity and other various construction element rigidity.

$$\frac{1}{K} = \frac{1}{K_\ell} + \frac{1}{K_n} + \frac{1}{K_b} + \frac{1}{K_h}$$

Where:
K_ℓ: Screw Shaft Compressive/Tensile Rigidity
K_n: Nut Rigidity
K_b: Support Bearing Rigidity
K_h: Nut and Bearing Mount Rigidity

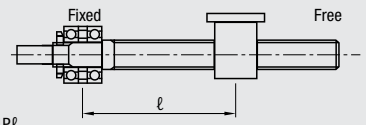
Screw Shaft Compressive/Tensile Rigidity : Kℓ

$$K_\ell = \frac{P}{\delta_\ell} \text{ (N/μm)}$$

Where:
P: Axial Load (N)
δ_ℓ: Screw Shaft Expansion/Contraction (μm)

The expansion and contraction are expressed in the following formula. The expansion and contraction will directly appear as ball screw backlash.

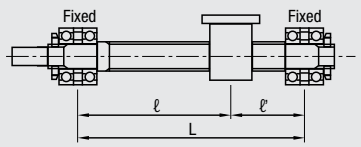
(1) Fixed-Free Arrangement



$$\delta_\ell = \frac{4P\ell}{E\pi d^2} \times 10^3 (\mu m)$$

Where:
P: Axial Load (N)
E: Young's Modulus ($2.06 \times 10^5 N/mm^2$)
d: Screw Shaft Root Diameter (mm)
ℓ: Load Applicable Span Distance (mm)

(2) Fixed-Fixed Arrangement



$$\delta_\ell = \frac{4P\ell\ell'}{E\pi d^2 L} \times 10^3 (\mu m)$$

Where:
P: Axial Load(N)
E: Young's Modulus ($2.06 \times 10^5 N/mm^2$)
d: Screw Shaft Root Diameter (mm)
ℓ,ℓ': Load Applicable Span Distance (mm)
L: Mounting Span Distance (mm)

The formula produces the max. value when $\ell = \ell' = \frac{L}{2}$

$$\left(\delta_\ell = \frac{PL}{E\pi d^2} \times 10^3 \right)$$

Therefore, the max. shaft expansion and contraction will be 1/4 of Fixed-Free arrangement.

Technical Data

Selection of Ball Screws 4

10. Driving Torque

This selection provides a guide for selecting ball screw frictional properties and the driving motor.

10-1. Friction and Efficiency

Ball screw efficiency can be expressed in the following formulas; wherein μ is the coefficient of friction and β is the screw's lead angle. Variables are determined through analysis of a dynamic model.

When rotational force is converted into axial force (Forward Action)

$$\eta = \frac{1-\mu \tan\beta}{1+\mu/\tan\beta}$$

When axial force is converted into rotational force (Reverse Action)

$$\eta' = \frac{1-\mu/\tan\beta}{1+\mu \tan\beta}$$

10-2. Load Torque

The load torque (constant speed driving torque) required in drive source design (motors,etc.) is calculated as follows.

(1) Forward Action

Torque required when converting rotational force into axial force

$$T = \frac{PL}{2\pi\eta} \ (N \cdot cm)$$

Where:
- T: Load Torque (N·cm)
- P: External Axial Load (N)
- L: Ball Screw Lead (cm)
- η: Ball Screw Efficiency (0.9)

(2) Reverse Action

External axial load when converting axial force into rotational

$$P = \frac{2\pi T}{\eta' L} \ (N)$$

Where:
- P: External Axial Load (N)
- T: Load Torque (N·cm)
- L: Ball Screw Lead (cm)
- η': Ball Screw Efficiency (0.9)

(3) Friction Torque Caused by Preloading

This is a torque generated by preloading. As external loads increase, the preload of the nut is released and therefore the friction torque by preloading also decreases.

Under No load

$$T_P = K\frac{P_L L}{2\pi} \ (N \cdot cm)$$

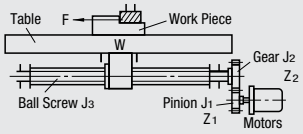
$$K = 0.05(\tan\beta)^{-\frac{1}{3}}$$

Where:
- P_L: Preload (N)
- L: Ball Screw Lead (cm)
- K: Coefficient of Internal Friction
- β: Lead Angle $\beta \fallingdotseq \tan^{-1}\left(\frac{L}{\pi D}\right)$
- D: Thread Outer Diameter

11. Selecting the Driving Motors

When selecting a driving motor, it is necessary to satisfy the following conditions:

1. Ensure a marginal force sufficient to counter the load torque exerted on the motor's output thread.
2. Enable starting, stopping at prescribed pulse speeds, sufficiently powered to counter the moment of inertia exerted on the motor's output thread.
3. Obtain the prescribed acceleration and deceleration constants, sufficient to counter the moment of inertia exerted on the motor's output thread.



(1) Constant Speed Torque Exerted on the Motor Output Thread

This is the amount of torque required to drive the output thread against the applied external load, at a constant speed.

$$T_1 = \left(\frac{PL}{2\pi\eta} + T_P\frac{(3P_L-P)}{3P_L}\right)\frac{Z_1}{Z_2} \ (N \cdot cm)$$

Where: $P \leqq 3P_L$
- T_1: Driving Torque at Constant Speed (N·cm)
- P: External Axial Load (N)
  P=F+μMg
- F: Thrust Reaction Produced in Cutting Force (N)
- M: Masses of Table and Work Piece (kg)
- μ: Coefficient of Friction on Sliding Surfaces
- g: Gravitational Acceleration (9.8m/s^2)
- L: Ball Screw Lead (cm)
- η: Mechanical Efficiency of Ball Screw or Gear
- T_P: Friction Torque Caused by Preloading (N·cm) Referto Formula 10-2-(3)
- P_L: Preload (N)
- Z_1: Number of Pinion's Teeth
- Z_2: No. of Gear's Teeth

(2) Acceleration Torque Exerted on the Motor Output Thread

This is the amount of torque required to drive the output shaft against the external load during acceleration.

$$T_2 = J_M\omega = J_M\frac{2\pi N}{60t}\times 10^{-3} \ (N \cdot cm)$$

$$J_M = J_1 + J_4 + \left(\frac{Z_1}{Z_2}\right)^2\left\{(J_2+J_3+J_5+J_6)\right\} \ (kg \cdot cm^2)$$

Where:
- T_2: Driving Torque in Acceleration (N·cm)
- ω: Motor Thread Angular Acceleration (rad/s^2)
- N: Motor Thread Revolutions (min^{-1})
- t: Acceleration (s)
- J_M: Moment of Inertia Exerted on the Motor (kg·cm^2)
- J_1: Moment of Inertia Exerted on Pinion (kg·cm^2)
- J_2: Moment of Inertia Exerted on Gear (kg·cm^2)
- J_3: Moment of Inertia Exerted on Ball Screw (kg·cm^2)
- J_4: Moment of Inertia Exerted on Motor's Rotor (kg·cm^2)
- J_5: Moment of Inertia of Moving Body (kg·cm^2)
- J_6: Moment of Inertia of Coupling (kg·cm^2)
- M: Masses of Table and Work Piece (kg)
- L: Ball Screw Lead (cm)

Moment of inertia exerted on cylinders as screws and cylinders such as Gears (Calculation of $J_1 \sim J_4$, J_6)

$$J = \frac{\pi\gamma}{32}D^4\ell \ (kg \cdot cm^2)$$

Where:
- D: Cylinder Outer Diameter (cm)
- ℓ: Cylinder Length (cm)
- γ: Material Specific Gravity
  $\gamma = 7.8\times10^{-3}$ (kg/cm^3)

$$J_5 = M\left(\frac{L}{2\pi}\right)^2 \ (kg \cdot cm^2)$$

(3) Total Torque Exerted on the Motor Output Thread

Overall torque can be obtained by adding results from formulas (1) and (2).

$$T_M = T_1+T_2 = \left(\frac{PL}{2\pi\eta} + T_P\frac{(3P_L-P)}{3P_L}\right)\frac{Z_1}{Z_2} + J_M\frac{2\pi N}{60t}\times 10^{-3} \ (N \cdot cm)$$

Where:
- T_M: Total Torque Exerted on the Motor Output Thread (N·cm)
- T_1: Driving Torque at Constant Speed (N·cm)
- T_2: Driving Torque at In Acceleration (N·cm)

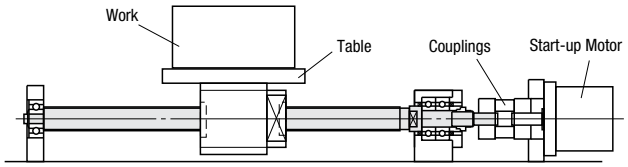
Once you have temporarily found the type of motor you need, check

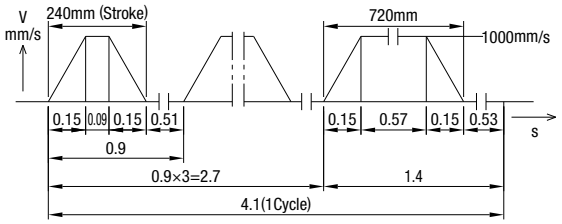
1. effective torque,
2. acceleration constant and
3. motor overload properties and heat tolerance during repeated starting, stopping.
   It is necessary to ensure a sufficient margin for these parameters.

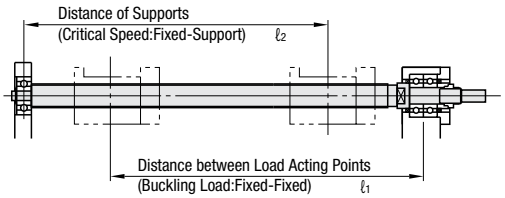
12. Example of Selection of Ball Screws

Condition of Use

• Work & Table Mass	• Life Span	W=50(kg)	±0.01(mm)
• Maximum Strokes	• Direct Acting Guide	Smax.=720(mm)	Lh=30000Hours
• Threading Speed	Coefficient of Friction	Vmax.=1000(mm/s)	μ=0.02
• Acceleration Constant	• Driving Motor	t=0.15(s)	Nmax.=3000(min^{-1})
• Positioning Precision	• Duty Cycle Model Diagram	±0.1/720(mm)	
• Repeat Accuracy			







1. Setting Lead (L)

Set lead based on maximum motor revolutions and threading speed. Use the following formula.

$$L \geqq \frac{Vmax \times 60}{Nmax} = \frac{1000 \times 60}{3000} = 20$$

Required lead is 20mm or higher.

2. Nut selection

(1) Calculating Axial Load

P. 216, 6-2. Axial Load calculation formula is used to obtain the axial loads for each segment of a motion profile.

- At Constant Speed: Axial Load (Pb) =μWg=0.02×50×9.8≒10 (N)
- In Acceleration: Acceleration(α) = (Vmax/t)×10^{-3} = (100/0.15)×10^{-3}=6.67 (m/s^2)
  Axial Load (Pa) =Wα+μWg=50×6.67+0.02×50×9.3≒343 (N)
- In Deceleration: Axial Load (Pc) Wα-μWg=50×6.67-0.02×50×9.8≒324 (N)

(2) Actual moving time during each segment in a motion profile

Below derived from Duty Cycle Model Diagram.

Operating Pattern	In Acceleration	At Constant Speed	In Deceleration	Total Operating Time
Operating Time	0.60	0.84	0.60	2.04

(3) Summary of Axial Loads, Rotational Speeds, and Operation Time for Each Motion Profile

Operating Pattern	In Acceleration	At Constant Speed	g Pattern In Deceleration
Axial Load	343N	10N	324N
Revolutions Frequency	1500min^{-1}	3000min^{-1}	1500min^{-1}
Operating Time Ratio	29.4%	41.2%	29.4%

(4) Calculating the Average Axial Load with a formula in **P. 216**, 6-3.

$$\text{Mean Axial Load(Pm)} = \left(\frac{P_1^3N_1t_1+P_2^3N_2t_2+P_3^3N_3t_3}{N_1t_1+N_2t_2+N_3t_3}\right)^{\frac{1}{3}} = 250(N)$$

(5) Calculating the mean turns

$$\text{Mean Turns (Nm)} = \frac{N_1t_1+N_2t_2+N_3t_3}{t_1+t_2+t_3} = 2118(\text{min}^{-1})$$

(6) Calculation of the required basic dynamic load rating

(1) Calculating Continuous Operational Life (Lho)

A Continuous Operational Life which is derived by subtracting Resting time from Desired Life while a motion profile of 4.01s with a moving time of 2.04s can be calculated as follows.

$$\text{Lho=Desired Life (Lh)} \times \left(\frac{2.04}{4.1}\right) = 14927 \text{ (Hours)}$$

(2) Calculating Required Basic Dynamic Load Rating

P. 216 6-1. contains a formula for calculating a Basic Dynamic Load Rating for continuous operational life.

$$C = \left(\frac{60L_{ho}N_m}{10^6}\right)^{\frac{1}{3}} \times P_m \times f_w = \left(\frac{60 \times 14927 \times 2118}{10^6}\right)^{\frac{1}{3}} \times 250 \times 1.2 = 3700(N)$$

(7) Tentative Ball Screw Selection

A ball screw to satisfy the requirements of Lead 20 and Basic Dynamic Load Rating of 3700N, BSS1520 is tentatively selected.

3. Accuracy Evaluation

(1) Evaluating Accuracy Grades and Axial Clearances

P. 212 2. "Ball Screw Lead Accuracy" section shows a table for accuracy values of various Accuracy Grades.

From the lead accuracy value table, it can be confirmed that the C5 Grade with Actual Mean Travel Error ±ep 0.040/800~1000mm will satisfy the requirement of ±0.1/720mm, and a BSS1520 is suitable.

Additionally, the Precision Screws axial clearance table on shows that axial clearance of BSS1520 is 0.005 or less.

The required positioning repeatability is ±0.01mm, and it can be confirmed that BSS1520 satisfies the requirement.

4. Screw Shaft Selection

(1) Determining the Overall Length

Screw Shaft O.A.L. (L)=

Max. Stroke+Nut Length+Margin+Shaft End Terminations (both sides). Therefore,

Max Stroke: 720mm
Nut Length: 62mm
Margin: Lead×1.5=60mm
Shaft End Termination Dims.: 72
Screw Shaft O.A.L. (L)=720+62+60+72=914mm

*The Margin is provided as a countermeasure in case overruns, and the amount is typically set as 1.5~2 times the screw lead.

Lead 20×1.5×2(Ends)=60

(2) Evaluating the Allowable Axial Load

Load Applicable Span Distance l1 is 820mm, and the Axial Load can be obtained by the formula on **P. 214**, "4. Allowable Axial Load" as below.

$$P = m\frac{d^4}{\ell^2}10^4 = 10 \times \frac{12.5^4}{820^2} \times 10^4 = 3660N$$

The above formula produces an Axial Load value of 343N which is well within the Allowable Max. Axial Load 3660N, and suitability is confirmed.

(3) Evaluating the Allowable Max. Rotational Speed

Shaft supported span is 790mm, and the formula in "5-1. Critical Speed" on produces a value for the Critical Speed Nc as **P. 215**

$$Nc = g\frac{d}{\ell^2}10^7 = 15.1 \times \frac{12.5}{790^2} \times 10^7 = 3024\text{min}^{-1}$$

The max. speed requirement of 3000min^{-1} is within the Critical Speed of 3024min^{-1}, and the suitability is confirmed.

Additionally, the DmN value can be evaluated with the formula in **P. 215**, "5-2. DmN Value" as...

DmN=(Shaft O.D.+A value)×Max Rotational Speed=15.8×3000=47400≤70000 and the suitability is confirmed.

5. Selection Result

From the above, it is determined that a suitable ball screw model is BSS1520-914.

Technical Data

Calculation of Life Span of Linear Systems 1

■ Allowable Load

- Basic Dynamic Load Rating (C)
  Basic dynamic load rating is a constant load applied in a constant direction that enables each linear system of the same series to travel 50×103m under the same conditions, without 90% of the material suffering damage from rolling contact fatigue.
- Basic Static Load Rating (Co)
  Basic static load rating is the static load exerted on contacting parts under maximum stress, at which the sum of the permanent deformation in the rolling element and rolling contact surface equals 0.0001 times the diameter of the rolling element.
- Allowable Static Moment (M_P, M_Y, M_R)
  Allowable static moment is a critical static moment load that acts upon a system at the loading moment. It is set in accordance with the permanent deformation as in basic static load rating Co.
- Static Safety Factor (f_S)
  Static safety factors are given in Table 1. When a linear system is still or moving at low speed, basic static load rating Co must be divided by fs in accordance with the conditions of use.

Table 1. Static Safety Factor (Lower Limit of f_s)

Condition of Use	Lower Limit of f_s
Under Normal Operating Conditions	1~2
When Smooth Travel is Required	2~4
When Subjected to Vibrations, Impacts	3~5

$$\text{Allowable Load (N)} \leq Co/f_S$$

$$\text{Allowable Moment (N·m)} \leq (M_P, M_Y, M_R)/f_S$$

f_S : Static Safety Factor

Co : Basic Static Load (N)

M_P, M_Y, M_R : Static Allowable Moment (N·m)

■ Life Span

When a load is applied to a linear system, the system moves back and forth in a linear direction. In the process, repeated stress acts upon rolling elements and rolling contact surfaces, causing damage referred to as flaking from material fatigue.

The life span of a linear system is measured in terms of the total travel distance covered by the system up until initial flaking occurs.

- Rated Life Span (L)

  Rated life span is the total travel distance that each linear system of the same series can endure under the same conditions, without the occurrence of flaking in 90% of the system.

  Rated life span can be obtained as follows from the basic dynamic load rating and various loads exerted on the linear system.

For Ball Bearings $$L=\left(\frac{C}{P}\right)^3\cdot 50$$

For Roller Bearings $$L=\left(\frac{C}{P}\right)^{10/3}\cdot 50$$

L : Rated Life Span (km)

C : Basic Dynamic Load Rating (N)

P : Acting Load (N)

- When actually using a linear system, the first thing you must do is to calculate the load. It is necessary to consider load also in terms of vibration and impact that occur during operation, as well as its distribution across the entire linear system as it moves back and forth in a linear direction. Calculations are not simple. Operating temperature also significantly influences useful life. When these parameters are taken into consideration, the above formula is transformed as follows:

For Ball Bearings $$L=\left(\frac{f_H\cdot f_T\cdot f_C}{f_W}\cdot\frac{C}{P}\right)^3\cdot 50$$

For Roller Bearings $$L=\left(\frac{f_H\cdot f_T\cdot f_C}{f_W}\cdot\frac{C}{P}\right)^{10/3}\cdot 50$$

L : Rated Life Span (km)

f_H : Hardness Coefficient (See Fig.1)

C : Basic Dynamic Load Rating (N)

f_T : Temperature Coefficient (See Fig.2)

P : Acting Load (N)

f_C : Contact Coefficient (See Table 3)

f_W : Load Coefficient (See Table 4)

The Life span can be computed as a number of hours by obtaining the travel distance for a unit of time.

It can be obtained by using the following formula, in which stroke length and stroke cycles are assumed to be constant.

$$L_h=\frac{L\cdot 10^3}{2\cdot \ell s\cdot n_1\cdot 60}$$

L_h : Life Span Hours (hr)

ℓs : Stroke Length (m)

L : Rated Life Span (km)

n_1 : Reciprocating Times per Minute (cpm)

■ Friction Resistance and Required Thrust

Using the following formula, the friction resistance (required thrust) can be obtained from the load and the seal resistance specified by the system.

Table 2. Dynamic Friction Coefficient

Type	Dynamic Friction Coefficient (μ)
Miniature Slide Guides	0.004~0.006
Medium Load Slide Guides	0.002~0.003
Slide Ways	0.001~0.003
Slide Tables	0.001~0.003
Linear Bushings	0.002~0.003
Linear Ball Bushings	0.0006~0.0012

F : Friction Resistance (N)

μ : Dynamic Friction Coefficient

W : Weight Loaded

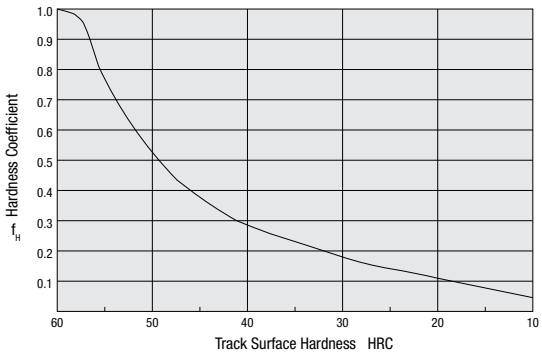
f : Seal Resistance (2N~5N)

• Hardness Coefficient (f_H)

In a linear system, the shaft must be hard enough to withstand contact with the ball bearings. Unless sufficient hardness is provided, the allowable load can decrease, resulting in a short useful life.

Compensate the rated life span with the hardness coefficient.

Figure 1. Hardness Coefficient



• Contact Coefficient (fC)

In general, two or more linear systems are used with each shaft. Depending on the machining precision, the load exerted on each of the respective systems can vary. In this case, the load applied on each linear system changes depending on the machining precision, therefore it cannot be uniformly applied. As a result, allowable load per linear system changes depending on the number of linear systems on one axis.

Compensate the rated life span with the contact coefficient in Table 3.

• Load Coefficient (f_W)

When calculating the load that acts on a linear system, it is necessary to work with precise figures for material weight, the force of inertia resulting from operating speed, load moment, various changes that occur over time, and so on. However, it is difficult to have accurate calculation for oscillating movement as beside the normal repetition of start and stop, other factors such as vibration and impact also need to be considered.

Therefore, the life span calculation needs to be simplified using the load coefficient in Table 3.

■ Linear Bushings

Rated life span can be obtained as follows from the basic dynamic load rating and the load to the linear bushing.

$$L=\left(\frac{f_H \cdot f_T \cdot f_C}{fw} \cdot \frac{C}{P}\right)^3 \cdot 50$$

L : Rated Life Span (km)
C : Basic Dynamic Load Rating (N)
P : Working Load (N)
fw : Load Coefficient (See Table 4.)
f_H : Hardness Coefficient (See Figure 1.)
f_T : Temperature Coefficient (See Figure 2.)
f_C : Contact Coefficient (See Table 3.)

The Life span can be computed as a number of hours by obtaining the travel distance for a unit of time. It can be obtained using the following formula, in which stroke length and stroke cycles are assumed to be constant.

$$L_h=\frac{L \cdot 10^3}{2 \cdot \ell s \cdot n_1 \cdot 60}$$

L_h : Life Span Hours (hr)
ℓs : Stroke Length (m)
L : Rated Life Span (km)
n_1 : Reciprocating Times per Minute (cpm)

• Temperature Coefficient (f_T)

When temperature in a linear system exceeds 100˚C, the hardness of the system and the shaft become degraded. This decreases the allowable load to a greater extent than when the system is used at ambient temperature, and can shorten the life span.

Compensate the rated life span with the temperature coefficient.

Figure 2. Temperature Coefficient

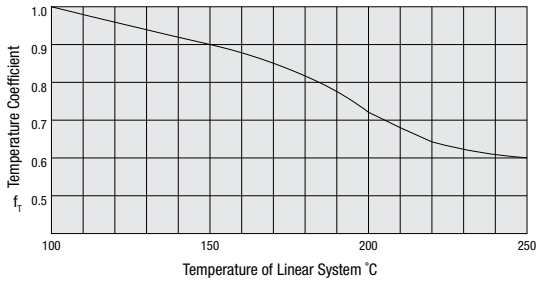


Table 3. Contact Coefficient

Number of Bearings per Shaft	Contact Coefficient fc
1	1.00
2	0.81
3	0.72
4	0.66
5	0.61

Table 4. Load Coefficients

Condition of Use	fw
Low speed with no external vibration or impact (Max. 15m/min)	1.0~1.5
Middle range speed with no exerted vibration or impact of considerable force (Max. 60m/min)	1.5~2.0
High speed with no external vibration or impact (Over 60m/min)	2.0~3.5

■ Linear Ball Bushings

Rated life span can be obtained as follows from the basic dynamic load rating and the load to the linear ball bushing.

$$L=\left(\frac{f_H \cdot f_T \cdot f_C}{fw} \cdot \frac{C}{P}\right)^3 \cdot 50$$

L : Rated Life Span (km)
C : Basic Dynamic Load Rating (N)
P : Working Load (N)
fw : Load Coefficient (See Table 4)
f_H : Hardness Coefficient (See Fig.1)
f_T : Temperature Coefficient (See Fig.2)
f_C : Contact Coefficient (See Table 3)

Life Span Hours

• For revolution and reciprocating motion

$$L_h=\frac{10^6 \cdot L}{60\sqrt{(dm \cdot n)^2+(10 \cdot S \cdot n_1)^2}/dm}$$

• For reciprocating motion

$$L_h=\frac{10^6 \cdot L}{600 \cdot S \cdot n_1/(\pi \cdot dm)}$$

L_h : Life Span Hours (hr)
n : Revolutions per Minute (rpm)
dm : Pitch Diameter of Ball (mm)≈1.15dr
S : Stroke Length (mm)
n_1 : Strokes Per Minute (cpm)

• Revolution and reciprocal motion allowable values

$$DN \geq dm \cdot n+10 \cdot S \cdot n_1$$

Technical Data

Calculation of Life Span of Linear Systems 2

■ Load Calculations

Since a linear system bears the weight of the work while it performs a reciprocating linear motion, the load exerted on the system can vary depending on the work's center of gravity, thrust acting position change, and the speed changes by starting, stopping and acceleration, deceleration.

It is necessary to take these conditions into consideration when selecting a linear system.

Table 5. Use Conditions and Load Calculation Formulas

Type	Condition of Use and Load	Type	Condition of Use and Load

Fig 3. Stepped Load Fluctuation

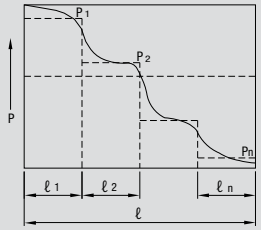

Fig 4. Flat Fluctuation Load

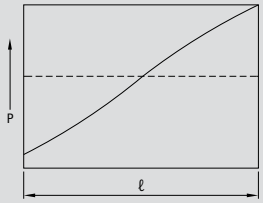

Fig 5. Sinusoidal Load Fluctuation

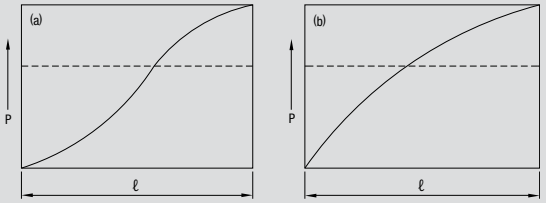


• Mean Load Derived from Fluctuating Loads

In general, the load acting upon a linear system can change according to how the system is used.This happens for example when the reciprocating motion is started, stopped as compared to constant speed motion, and whether or not work is present during transfer, etc. Therefore, in order to correctly design the life span under various conditions and fluctuating loads, it is necessary to obtain a mean load and apply it to the life span calculations.

(1) When load changes in steps by a travel distance (Fig 3.)
Travel distance ℓ_1 subjected to load P_1
Travel distance ℓ_2 subjected to load P_2
⋮ ⋮
Travel distance ℓn subjected to load Pn
Mean load Pm can be obtained by using the following formula:

$$P_m = \sqrt[3]{\frac{1}{\ell}\left(P_1^3\ell_1 + P_2^3\ell_2 \cdots + Pn^3\ell n\right)}$$

P_m : Mean Load Derived from Fluctuating Loads (N)
ℓ : Total Travel Distance (m)

(2) When load changes almost linearly (Fig 4.)
Mean load P_m can be approximated by the following formula:

$$P_m \approx \frac{1}{3}\left(P_{min} + 2\cdot P_{max}\right)$$

P_{min} : Min. Fluctuating Load (N)
P_{ma} : Max. Fluctuating Load (N)

(3) When the load change resembles a sinusoidal curve as shown in Fig 5.
(a), (b), Mean Load Pm can be approximated by the following formula:

Fig 5.(a) $P_m \approx 0.65P_{max}$
Fig 5.(b) $P_m \approx 0.75P_{max}$

■ Slide Guides

Rated life span is the total travel distance each linear guide of the same series can endure under the same conditions, without the occurrence of flaking in 90% of the system.
Rated life span can be obtained as follows from the basic dynamic load rating and the load to the slide guide.

$$L = \left(\frac{f_T}{f_w}\cdot\frac{C}{P}\right)^3\cdot 50 \qquad (1)$$

L : Rated Life Span (km)
f_T : Temperature Coefficient (See Fig 2.)
fw : Load Coefficient (See Fig 4.)
C : Basic dynamic load rating (N)
P : Acting Load (N)

The life span hours can be computed as a number of hours by obtaining the travel distance for a unit of time. It can be obtained by using the following formula, in which stroke length and stroke cycles are assumed to be constant.

$$Lh = \frac{L\cdot 10^3}{2\cdot \ell s\cdot n_1\cdot 60} \qquad (2)$$

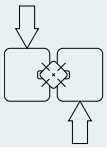
Lh : Life Span Hours (hr)
L : Rated Life Span (km)
ℓs : Stroke Length (m)
n_1 : Reciprocating Times per Minute (cpm)

■ Slide Ways

Rated load for slide ways is determined by the rolling elements(numbers of rollers). It can be calculated by using the following formulas:

One shaft is used

Load Direction



Dynamic Load Rating

$$(N)\quad C = \left(\frac{Z}{2}\right)^{3/4}\cdot C_1$$

Static Load Rating

$$(N)\quad C_0 = \left(\frac{Z}{2}\right)\cdot C_{01}$$

One shaft is used vertically

Load Direction

Dynamic Load Rating

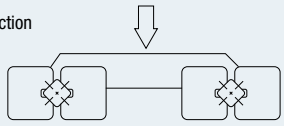
$$(N)\quad C = \left(\frac{Z}{2}\right)^{3/4}\cdot C_1\cdot 2^{7/9}$$

Static Load Rating

$$(N)\quad C_0 = \left(\frac{Z}{2}\right)\cdot C_{01}\cdot 2$$

Two shafts are used in parallel

Load Direction



Dynamic Load Rating

$$(N)\quad C = \left(\frac{Z}{2}\right)^{3/4}\cdot C_1\cdot 2^{7/9}$$

Static Load Rating

$$(N)\quad C_0 = \left(\frac{Z}{2}\right)\cdot C_{01}\cdot 2$$

C_1 : Basic Dynamic Load Rating per Roller (N)
C_{01} : Basic Static Load Rating per Roller (N)
Z : Number or Rolling Elements

The life span for slide ways is calculated by using the following formula.

$$L = \left(\frac{f_T\cdot C}{fw\cdot P}\right)^{10/3}\cdot 50$$

L : Life Span Hours (km)
f_T : Temperature Coefficient (See Fig 2.)
fw : Load Coefficient (See Fig 4.)
C : Dynamic Load Rating (N)
P : Acting Load (N)

Life Span Hours

$$L_h = \frac{L\cdot 10^3}{2\cdot \ell s\cdot n_1\cdot 60}$$

L_h : Life Span Hours (hr)
L : Life Span Hours (km)
ℓs : Stroke Length (m)
n_1 : Reciprocating Times per Minute (cpm)

Technical Data

Selection of Single Axis Actuators 1

Select the nominal LX actuator from the travel and the rating list below. ➡ Determine the ball screw lead so that the operation speed will be within the maximum speed shown in (Table 4). At this stage, the selection is temporary. ➡ Examine the load applied to the rail and put it in formulas (1) and (2) on **page 225**. Obtain the equivalent load Fe for each process and put it in formula (3) on **page 225**. Obtain the average load Fm and calculate the lifetime. ➡ Examine the load applied to the ball screw and the support bearing. Put it in formula (3) on **page 225**, obtain the average load Fm and calculate the lifetime.

■ Rated load (Table 1)

Item			LX2001	LX2005	LX2602	LX2605	LX3005	LX3010	LX4510	LX4520

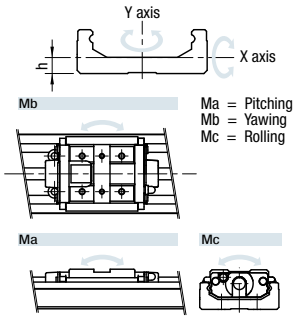
■ Load coefficient fw (Table 7)

Vibration/ Impact	Speed	fw
Subtle	Super-low speed V≤ 0.25m/s	1~1.2
Small	Low speed 0.25m/s<V≤ 1m/s	1.2~1.5
Medium	Medium speed 1m/s <V≤ 2m/s	1.5~2
Large	High speed 2m/s<V	2~3.5

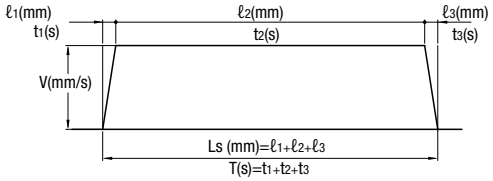


Selection is easy with Single Actuator calculation tool available at:
http://fawos.misumi.jp/FA_WEB/unit/web/misumi_LX_en.html

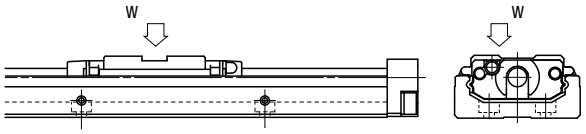
Life Span

For the LX actuator, calculate the life span of the rail, ball screw and support bearing. The actuator life span is determined to be the smallest value from among these results.

Load Mass	: W kg
Stroke	: Ls mm
Acceleration	: a mm/s^2
Maximum Speed	: v mm/s
Gravity	: g=9.81m/s^2
Acceleration	: Horizontal
Speed Diagram	: (Fig 1.)
Operating Conditions	: (Fig 2.)



Speed diagram (Fig. 1)



Status of load applied (Fig. 2)

Examination Selection

Select the temporary model number based on the load mass W (kg) and the maximum speed V (mm/s). Then prepare a speed diagram based on the acceleration, maximum speed and travel. The conditions that can develop this speed diagram will serve as the basis for the selection calculation.

Calculation Lifetime Calculation Example

Examine the status of the load applied (Fig. 2) to the rail of the LX actuator. Put each load in the formula below (formula (1) for single nut block specifications and formula (2) for double nut block specifications), and obtain the equivalent load Fe.

Equivalent Load

• In the case of single block

$$Fe=Y_HF_H+Y_VF_V+YpKpMa+YyKyMb+YrKrMc \quad -(1)$$

• In the case of double block

$$Fe=Y_HF_H/2+Y_VF_V/2+Y_RK_RMa+Y_PK_PMb+Y_YK_YMc \quad -(2)$$

F_e : Equivalent Load
F_H : Horizontal load acting on blocks
F_V : Vertical load applied to the block
Ma : Pitching direction moment applied to the block
Mb : Yawing direction moment applied to the block
Mc : Rolling direction moment applied to the block
Kp : Equivalent coefficient for pitching direction moment
Ky : Equivalent coefficient for yawing direction moment
Kr : Equivalent coefficient for rolling direction moment
Y_H,Y_VYp,Y_Y,Y_R:1.0 or 0.5

When the actuator is used under moment loads, calculate the load by multiplying the guide moment equivalent coefficient in Table 2. In formulas (1) and (2), in order to obtain the equivalent load Fe, the maximum value among FH, Fv, KpMa, KyMb and KrMc is determined to be 1.0, and the remaining items are set at 0.5.

Average Load

As Ma and Mb for the LX actuator vary with acceleration and deceleration, obtain the average load Fm from formula (3).

$$Fm=\sqrt[3]{\frac{1}{L_S}(Fe_1^{3}\cdot L_1+Fe_2^{3}\cdot L_2+Fe_3^{3}\cdot L_3\cdot\cdot Fen^{3}\cdot Ln)} \quad -(3)$$

Fm: Average load for fluctuating loads (N) L: Total travel distance (km)

Rail Life Span

Obtain the rail life span for the LX actuator from formula (4).

$$L=La\times\left(\frac{C}{fw\cdot Fm}\right)^{3} \quad -(4)$$

L: Rail lifetime (km) La: Travel distance (km) fw: Load coefficient
C: Basic dynamic load rating (N)

When the travel length and the number of reciprocal motions per minute are constant, the number of life span hours can be calculated from formula (5).

$$Lh=\frac{L\times10^{6}}{2\cdot\ell s\cdot n1\times60} \quad -(5)$$

Lh: Life span hours (h) ℓs: Travel (mm) n1: Reciprocal motions per minute

Life span of ball screw and support areas

Obtain the average load from the load applied in the axial direction. Calculate life span for both ball screws and bearings from formula (6). Obtain the average load from formula (3).

$$Lr=\left(\frac{Ca}{fw\cdot Fm}\right)^{3}\cdot\ell\times10^{6} \quad -(6)$$

Lr: Life span of ball screw (km) ℓ: Ball screw lead (mm)
fw: Load coefficient Ca: Basic dynamic load rating of screw and support (N)

Technical Data

Selection of Single Axis Actuators 2

Rated lifetime calculation example

1 Model number for examination

Operating conditions : LX26

Rail : C (Basic dynamic load rating)=6522N Co (Basic static load rating)=11871N

Ball screw : Ca (Basic dynamic load rating)=1712N Coa (Basic static load rating)=2251N

Support bearings : Ca (Basic dynamic load rating)=1637N Poa (Basic static load rating)=1205N

Load mass : 10kg

Maximum speed : 250mm/s

Acceleration : 833mm/s^2

Stroke : 200mm

Gravity : g=9.81m/s^2

Position : Horizontal

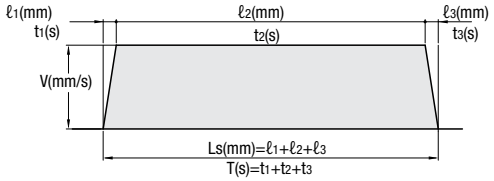
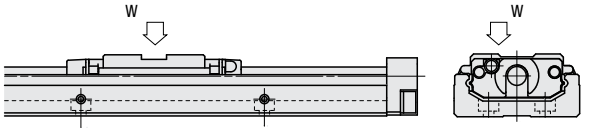
Operating Conditions : (Fig. 2)



Speed diagram (Fig. 1)



Status of load applied (Fig. 2)

2 Examination

Temporary selection

Use a travel distance of 200 mm with an acceleration of 833 mm/s^2 and a maximum speed of 250 mm/s. Based on these conditions, assume that the LX26 series is used.
(The selection software can be used on the Misumi website after customer registration has been completed.)

3 Calculation

3–1 Examination of rail

Multiply the moment equivalent coefficient in the table with the load according to the condition in which one nut block is used.

Load for Nut Block

1) At constant speed

$Fe_1=Yv\ \ Fv=Yv\cdot W\cdot g=1\cdot 10\cdot 9.81=98.1(N)$

2) At acceleration

$Fe_2=YvFv+Yp\ \ Kp\ \ Ma=0.5\cdot 98.1+1\cdot 0.17\cdot 70\cdot 0=60.95(N)$

3) At deceleration

$Fe_3=Yv\ \ Fv+Yp\ \ Kp\ \ Ma=0.5\cdot 98.1+1\cdot 0.17\times 70\cdot 0=60.95(N)$

Static safety coefficient

$$fs=\frac{Co}{Femax}=\frac{Co}{W\cdot g}=\frac{11871}{98.1}=121.1$$

Rated Life Span

Axial average load

$$Fm=\sqrt[3]{\frac{1}{Ls}\left(Fe_1^{\,3}\cdot L_1+Fe_2^{\,3}\cdot L_2+Fe_3^{\,3}\cdot L_3\cdot\cdot Fen^3\cdot Ln\right)}=87.72(N)$$

Rated life span

$$L=\left(\frac{C}{fw\cdot Fm}\right)^3\times 50=11.89\times 10^6$$

fw : Load coefficient 1.2
La : Travel distance

3–2 Examination of ball screw

Obtain the axial loads for the parts and the average load from the speed diagram.

Lifetime of Ball Screw

Axial load

1) At constant speed

$Fe_1=\mu\cdot W\cdot g=0.01\times 10\times 9.81=0.981(N)$

2) At acceleration

$Fe_2=Fe_1+W\cdot a\times 10^{-3}=0.981+10\cdot 0.833=9.311(N)$

3) At deceleration

$Fe_3=Fe_1-W\cdot a\times 10^{-3}=7.352(N)$

Static safety coefficient

$$fs=\frac{Coa}{Femax}=\frac{Coa}{Fe_2}=\frac{2251}{9.311}=241.76$$

Selection is easy with Single Actuator calculation tool available at:
http://fawos.misumi.jp/FA_WEB/unit/web/misumi_LX_en.html

Buckling Load

$$P_1=\frac{n\cdot\pi^2\cdot E\cdot I}{\ell a^2}\times 0.5=5562.02(N)$$

P_1 : Buckling load
ℓa : Distance between mounting points 250(mm)
E : Young's modules $2.06\times10^5(N/mm^2)$
n : Coefficient according to mounting method
0.5 : Safety factor
I : Minimum geometrical moment of inertia of screw shaft

$$I=\frac{\pi\cdot d_1^{\,4}}{64}=85.49(mm^4)$$

d1 : Root diameter of screw shaft 6.46(mm)

Allowable tension/compression load

$$P_2=\frac{\delta\cdot\pi\cdot d_1^{\,2}}{4}=4818.06$$

P_2 : Allowable tension/compression load (N)
δ : Allowable tension/compression stress $147(N/mm^2)$
d_1 : Root diameter of screw shaft 6.46(mm)

Critical Speed

$$N1=\frac{60\cdot\lambda^2}{2\pi\cdot\ell b^2}\cdot\sqrt{\frac{E\times10^3\cdot I}{\gamma\cdot A}}\times 0.8=12485(min^{-1})$$

N1 : Critical speed
ℓb : Distance between mounting points
E : Young's modules $2.06\times10^5(N/mm^2)$
λ : Coefficient according to mounting method (Fixed-Support 3.927)
γ : Density $(7.85\times10^{-6}kg/mm^3)$
0.8 : Safety factor

DN value

DN=62250(≤70000)

D : Ball center to center diameter (8.3mm)
N : Maximum number of operating revolutions (min^{-1})

Rated Life Span

Axial average load

$$Fm=\sqrt[3]{\frac{1}{Ls}\left(Fe_1^{\,3}\cdot L_1+Fe_2^{\,3}\cdot L_2+Fe_3^{\,3}\cdot L3\cdot\cdot Fen^3\cdot Ln\right)}=6.096(N)$$

Rated life span

$$L=\left(\frac{Ca}{fw\cdot Fm}\right)^3\cdot\ell\times10^6=25.64\times10^6(km)$$

fw : Load coefficient 1.2
ℓ : Ball screw lead 2 (mm)

3–3 Examination of support bearing

Axial load

$Fe_1=0.981(N)$
$Fe_2=9.311(N)$
$Fe_3=7.352(N)$

Static safety coefficient

$$fs=\frac{Poa}{Femax}=\frac{Poa}{Fe_2}=129.42$$

Equivalent Load

Axial average load

$$Fm=\sqrt[3]{\frac{1}{L_S}\left(Fe_1^{\,3}\cdot L_1+Fe_2^{\,3}\cdot L_2+Fe_3^{\,3}\cdot L_3\cdot\cdot Fen^3\cdot Ln\right)}=6.096(N)$$

Rated lifetime

$$L=\left(\frac{Ca}{fw\cdot Fm}\right)^3\cdot\ell\times10^6=22.41\times10^6(km)$$

fw : Load coefficient 1.2
ℓ : Ball screw lead 2 (mm)

(3) 2.5mm is included in this class. (4) Applies when a retaining ring is not installed.

Dimension Tolerance

- $\triangle_{dmp}$: Tolerance of Mean Inner Diameter within the Plane
- $\triangle_{Dmp}$: Tolerance of Mean Outer Diameter within the Plane
- $\triangle_{Bs}$: Measured Inner Ring Tolerance or Height Tolerance of Center Orbiting Plate
- $\triangle_{Cs}$: Measured Outer Ring Tolerance

Dimensional Inequality

- V_{dp} : Inner Diameter Inequality within the Plane
- V_{dmp} : Mean Inner Diameter Inequality within the Plane
- V_{Dp} : Outer Diameter Inequality within the Plane
- V_{DMp}: Mean Outer Diameter Inequality within the Plane
- V_{Bs} : Inequality of Inner Ring Widths
- V_{Cs} : Inequality of Outer Ring Widths

Rotation Precision

- K_{ia} : Radial Deviation of Inner Rings
- K_{ea} : Radial Deviation of Outer Rings

About IP Codes for Sensor Switches

- IP codes in this catalog are based on "Protection Statement for Equipments" of IEC 529:1989. Sealing ability may be affected by the conditions or environment in which it is used, such as cutting oil, chemicals, or existence of dust.

IP 6 7

(International Protecion)
First Characteristic Numeral (0~6):Ingress of Solid Foreign Objects
Second Characteristic Numeral(0~8):Ingress of Water with Harmful Effects

Characteristic Numeral	Ingress of Solid Foreign Objects	Ingress of Water with Harmful Effects
0	Non-Protected	Non-Protected
1	Protected against solid foreign objects 50mm in diameter or greater.	Protected against vertically falling water drops.
2	Protected against solid foreign objects 12.5mm in diameter or greater.	Protected against vertically falling water drops angled within 15 degree.
3	Protected against solid foreign objects 2.5mm in diameter or greater.	Protected against spraying water.
4	Protected against solid foreign objects 1.0mm in diameter or greater.	Protected against splashing water.
5	Dust-protected: Prevents the penetration of dust in amounts interfering with equipment operation.	Protected against water jetting from any direction.
6	Dust-tight:No ingress of dust.	Protected against powerful water jetting from any direction.
7	—	Protected against ingress of water in quantities causing harmful effects when the enclosure is temporarily immersed.
8	—	Protected against ingress of water in quantities causing harmful effects when the enclosure is continuously immersed in water under conditions more severe than No. 7, as determined by the parties concerned.

Technical Data

How to Use Coil Springs and Precautions

■ How to Use Coil Springs and Precautions

MISUMI is engaged in a constant effort to design coil springs (excluding Round Wire Springs) with optimum cross-sectional shape and maximum durability. When using the springs, pay due attention to the following precautions and undesirable usage that should be avoided for the sake of safety.

(1) Always Use A Spring Guide

When used without a spring guide, the coil spring may buckle or bend midway. This can cause it to break since the internal surface of the bending is subjected to concentrated high stress. Be sure to use a spring guide, such as a shaft and an outer diameter guide, with the coil spring.

*In most cases, the best results are obtained by inserting a shaft all the way through the coil spring, from top to bottom, as an inner diameter guide.

(2) Clearance between the Spring Inner Diameter and Shaft

When clearance between the spring and the shaft is insufficient, the coil spring's internal surface may come into contact with the shaft and be subject to abrasion at that point. This can lead to the spring eventually breaking at the point of wear. Excessive clearance with shaft, on the other hand, can lead to buckling of the coil spring. It is recommended that the shaft diameter be set approximately 1.0 mm smaller than the inner diameter of the coil spring.

When the coil spring has a long free length (i.e., free length/OD is 4 or larger), set up a step on the shaft as shown in Fig.-1 to prevent the coil spring's internal surface from touching the shaft when it bends.

(3) Clearance between The Spring OD and Counterbore Hole

The coil spring expands in the outward direction when it deflects. Insufficient clearance between the spring and the counterbore hole restrains expansion, and the resulting concentration of stress can cause the coil spring to break. It is recommended that the counterbore diameter be set approximately 1.5mm larger than the outer diameter of the coil spring. The counterbore configuration shown in Fig.-1 is ideal for a coil spring with a long free length.

(4) Avoid A Short Shaft Length and Shallow Counterbore Hole Depth

If the guide is too short, the coil spring may touch the guides tip when it is buckled. The resulting friction can cause the coil spring to break. It is recommended that the guide length be set longer than half of the initial height. Also make sure to chamfer the shaft to around C3 level.

(5) Do Not Use in Excess of The Maximum Deflection (300,000 times limit) or Near Its Solid Length

When the coil spring is used in excess of the 300,000 times limit, its Cross-section starts receiving stress that is higher than the theoretical value. This can cause the coil spring to break. Furthermore, when the coil spring is used at around its solid length, its active coils gradually adhere to each other, increasing the spring constant value and causing the load curve to rise, as shown in Fig.-2. Do not use the coil spring in excess of the 300,000 times limit.

(6) Set up An Initial Deflection

When there is a gap for the coil spring to move vertically, it receives an impact force that causes it to bend midway or to buckle.

Setting up an initial deflection stabilizes the top and bottom ends of the spring.

(7) Avoid Entrapment of Debris or Foreign Matter

Debris or foreign matter that becomes caught between the coils cause that part of the coil spring to stop functioning as active coils, forcing the other coils to deflect, as shown in Fig.-3. This effectively reduces the number of active coils, increasing the stress on the spring, and eventually causing it to break. Be careful not to allow debris or foreign matter to clog the coils.

(8) Keep Mounting Faces Parallel

The coil spring should be mounted properly, with its mounting faces top and bottom faces parallel to each other. Misalignment can cause the spring to bend midway, subjecting the bend to high stress. This can cause the spring to break at the point. The same applies to the dies in which the coil spring is used, if the parallel alignment between the dies is poor, as shown in Fig.-4, the coil spring can bend midway or exceed the 300,000 times limit prematurely. Keep the coil spring mounting faces as perfectly parallel as possible to prevent this from occurring.

(9) Do Not Use Coil Springs in Series

If you use two coil springs in series, they will tend to bend, as shown in Fig.-5. This can cause them to move out of the shaft, counterbore holes. If this happens, this coil spring will eventually break for the same reasons described in (1) above. Moreover, due to spring load differences, the weaker spring is overcome by, and deflects more than, the stronger spring, as shown in Fig.-6. This will make the weaker spring more prone to damage, or cause it to break.

(10) Do Not Use Two Coil Springs in Parallel

Use of two coil springs in parallel, as shown in Fig.-7, may result in the inner coils being sandwiched between the outer coils, or vice versa, when they contract. This can cause the coil springs to break for the same reason noted in (4).

(11) Do Not Use the Coil Spring Horizontally

When the coil spring is used horizontally, the internal surface of the spring will come into contact with the shaft, causing abrasion at those spots. The spring will eventually break at these weakened spots.

MISUMI Endurance Test Conditions

(1) Spring Guide Formula
Shaft Penetration
Shapt Dia.: -1.0mm less than d dimension

(2) Initial Deflection
1.0mm

(3) Amplitude
Deflection with 300,000 time limit value

(4) Velocity
180spm

*The maximum number of allowable operating times may vary depending on the service conditions.

Spring Calculations

1. Calculation

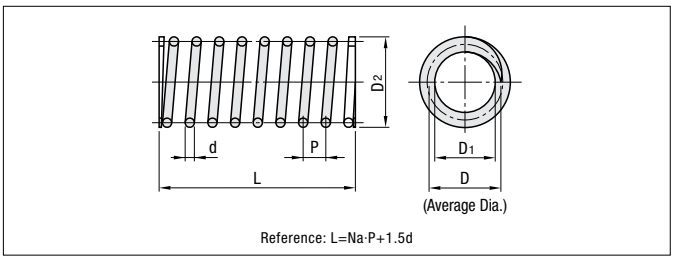
1.1 Symbols Used in Spring Design Formulae

Symbols used in spring design formulae are shown in Table 1.

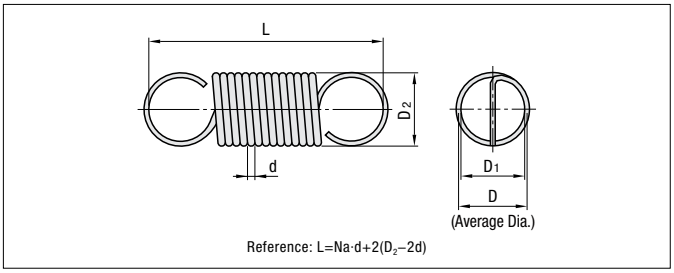
Table 1. Meaning of Symbols

Symbol	Meaning of Symbols	Unit
d	Diameter of Material	mm
D_1	Inner Diameter of a Coil	mm
D_2	Outer Diameter of a Coil	mm
D	Coil Mean Diameter= $\frac{D_1+D_2}{2}$	mm
N_t	Total Number of Winding	–
N_a	Number of Active Winding	–
L	Free Length(Length)	mm
H_S	Solid Length	mm
p	Pitch	mm
P_i	Initial Tension	N{kgf}
c	Spring Index $c=\frac{D}{d}$	–
G	Shear Modulus of Elasticity	N/mm^2{kgf/mm^2}
P	Load on Spring	N{kgf}
δ	Spring Deflection	mm
k	Spring Constant	N/mm{kgf/mm}
τ_0	Torsional Stress	N/mm^2{kgf/mm^2}
τ	Corrected Torsional Stress	N/mm^2{kgf/mm^2}
τ_i	Initial Stress	N/mm^2{kgf/mm^2}
χ	Stress Correction Factor	–
f	Frequency	Hz
U	Spring-Retained Energy	N·mm{kgf·mm}
ω	Per Unit Volume Material Weight	kg/mm^3
W	Mass of Moving Parts	kg
g	Gravitational Acceleration (1)	mm/s^2

Note (1) In spring calculations, a gravitational acceleration of 9806.65mm/s^2, is used.



Reference: L=Na·P+1.5d



Reference: L=Na·d+2(D$_2$−2d)

1.2 Basic Formulae Used in Designing of Springs

1.2.1 Compression Springs, and Tension Springs without Initial Tension

$$\delta=\frac{8N_aD^3P}{Gd^4} \quad (1) \qquad \tau=\chi\tau_0 \quad (5)$$

$$k=\frac{P}{\delta}=\frac{Gd^4}{8N_aD^3} \quad (2) \qquad d=\sqrt[3]{\frac{8DP}{\pi\tau_0}}=\sqrt[3]{\frac{8\chi DP}{\pi\tau}} \quad (6)$$

$$\tau_0=\frac{8DP}{\pi d^3} \quad (3) \qquad N_a=\frac{Gd^4\delta}{8D^3P}=\frac{Gd^4}{8D^3k} \quad (7)$$

$$\tau_0=\frac{Gd\delta}{\pi N_aD^2} \quad (4) \qquad U=\frac{P\delta}{2}=\frac{k\delta^2}{2} \quad (8)$$

1.2.2 Tension Springs with Initial Tension (Where:P>Pi)

$$\delta=\frac{8N_aD^3(P-P_i)}{Gd^4} \quad (1') \qquad \tau=\chi\tau_0 \quad (5')$$

$$k=\frac{P-Pi}{\delta}=\frac{Gd^4}{8N_aD^3} \quad (2') \qquad d=\sqrt[3]{\frac{8DP}{\pi\tau_0}}=\sqrt[3]{\frac{8\chi DP}{\pi\tau}} \quad (6')$$

$$\tau_0=\frac{8DP}{\pi d^3} \quad (3') \qquad N_a=\frac{Gd^4}{8D^3k}=\frac{Gd^4\delta}{8D^3(P-P_i)} \quad (7')$$

$$\tau_0=\frac{Gd\delta}{\pi N_aD^2}+\tau_i \quad (4') \qquad U=\frac{(P+P_i)\delta}{2} \quad (8')$$

1.3 Points to Note when Designing Springs

1.3.1 Shear Modulus of Elasticity

Shear modulus of elasticity(G) listed in Table 2 is recommended for the designing of springs.

Table 2. Shear Modulus of Elasticity(G)

Material		G Value N/mm^2 (kgf/mm^2)	Symbol
Spring Steel		78×10^3{8×10^3}	SUP6, 7, 9, 9A, 10, 11A, 12, 13
Hard Steel Wire		78×10^3{8×10^3}	SW-B, SW-C
Piano Wire		78×10^3{8×10^3}	SWP
Oil Tempered Steel Wire		78×10^3{8×10^3}	SWO, SWO-V, SWOC-V, SWOSC-V, SWOSM, SWOSC-B
Stainless Steel Wire	SUS 302	69×10^3{7×10^3}	SUS 302
	SUS 304		SUS 304
	SUS 304N1		SUS 304N1
	SUS 316		SUS 316
	SUS 631 J1	74×10^3{7.5×10^3}	SUS 631 J1

1.3.2 Number of Active Winding

The number of active winding can be determined as follows.

(1) Compression Springs

$N_a=N_t-(X_1+X_2)$

Where X1 and X2: are the number of turns at each end of the coil.

(a) When only the end of the coil is in contact with the next free coil
[Corresponding to (a) ~ (c) in Fig.2]

$X_1=X_2=1$

Therefore, $N_a=N_t-2$

(b) When the end of the coil is not in contact with the next coil, and the spring end has $\frac{3}{4}$ of a turn.
[Corresponding to (a) ~ (e) in Fig.2]

$X_1=X_2=0.75$

Therefore, $N_a=N_t-1.5$

(2) Tension Springs

The number of active winding can be determined as follows. But hooks are ignored.

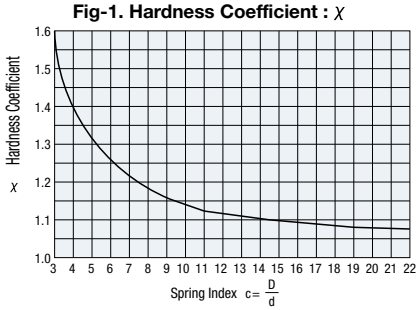
$N_a=N_t$

1.3.3 Stress Correction Factor

The stress correction factor relative to the spring index (C) can be determined by using the following formula or based on Fig.1.

$$\chi = \frac{4c-1}{4c-4} + \frac{0.615}{c} \quad \cdots\cdots (9)$$

Fig-1. Hardness Coefficient : χ



1.3.4 Solid Length

The solid length of a spring can normally be obtained by using the following simplified formula. Generally, the purchaser of a compression spring does not specify the solid length of the spring.

$$H_s=(N_t-1)d+(t_1+t_2) \quad \cdots\cdots (10)$$

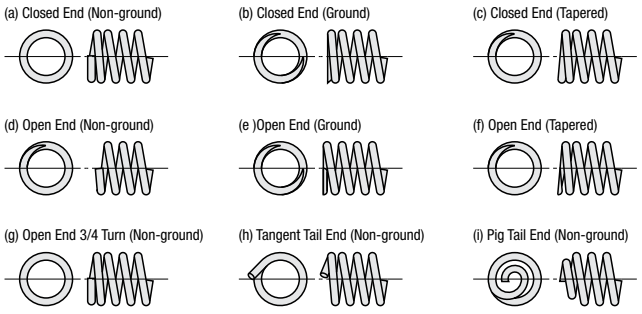
where, (t_1+t_2) : is the sum of the thicknesses of the coil ends.

As for those compression springs, both ends of which are shaped as shown in (b), (c), (e) or (f) of Figure 2 and for which the solid length needs to be specified, the following formula can be used to obtain the maximum solid length. However, the actual maximum solid length can be greater than the value thus calculated depending on the shape of the spring in question.

$$H_s=N_t\times d_{max} \quad \cdots\cdots (11)$$

where dmax : d is the material diameter with the maximum tolerance.

Fig-2. Coil End Shape



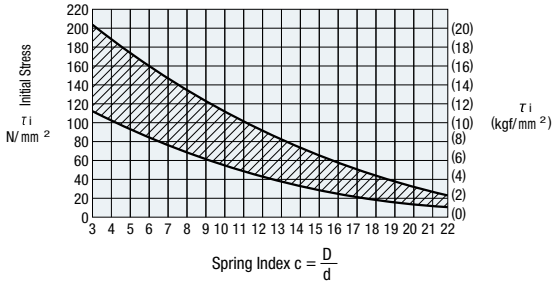
1.3.5 Initial Tension of Tension Springs

Cold-formed solid-coiled tension springs are subjected to initial tension (Pi).
The initial tension can be obtained using the following formula.

$$P_i=\frac{\pi d^3}{8D}\tau_i \quad \cdots\cdots (12)$$

On solid-coiled piano wire, hard steel wire, and other steel wires that are not low-temperature annealed, the initial stress occurs within the hatched range shown in Fig.3. However, if materials other than steel wire are used, or the wire in question is low-temperature annealed, the initial stress taken from within the hatched range in Fig.3 should be corrected as follows.

Fig-3 Initial Stress : τi (Spring formed from steel coil, not low-temperature annealed)



(1) When using stainless steel wire, decrease the initial stress value for steel wire by 15%.

(2) If the spring is low-temperature annealed after being formed, decrease the value by 20~35% for springs made of piano wire, hard steel wire, or other stainless steel wires, and by 15~25% for springs made of stainless steel wire.

Reference In place of Fig.3, the following empirical formula can be used to establish the initial stress for springs before low-temperature annealing.

$$\tau_i=\frac{G}{100c}$$

The following examples are for applications of this formula to obtain the initial tension.

(1) Piano Wire / Hard Steel Wire [$G=78\times10^3$N/mm^2 {8×10^3kgf/mm^2}]

Initial Stress $\tau_i=\frac{G}{100c}\times0.75$ (0.75 by 25, reduction by low-temperature annealing).

Initial Tension $P_i=\frac{\pi d^3}{8D}\ \tau_i=\frac{Gd^4}{255D^2}\times0.75=\frac{229d^4}{D^2}\left\{\frac{24d^4}{D^2}\right\}$

(2) When using stainless steel wire [$G=69\times10^3$N/mm^2{7×10^3kgf/mm^2}]

Initial Stress $\tau_i=\frac{G}{100c}\times0.8$(0.8 by 20, reduction by low-temperature annealing).

Initial Tension $P_i=\frac{\pi d^3}{8D}\ \tau_i=\frac{Gd^4}{255D^2}\times0.8=\frac{216d^4}{D^2}\left\{\frac{22d^4}{D^2}\right\}$

1.3.6 Surging

In order to prevent surging, the spring selected should be as that its natural frequency does not resonate with any of the natural frequencies that may act upon the spring.
The initial tension can be obtained using the following formula.

$$f=a\sqrt{\frac{kg}{W}}=a\frac{70d}{\pi N_a D^2}\sqrt{\frac{G}{\omega}} \quad \cdots\cdots (13)$$

Where, $a=\frac{i}{2}$:when both spring ends are either free or fixed

$a=\frac{2i-1}{4}$:When one spring end is fixed while the other end is free i=1,2,3

$G=78\times10^3$N/mm^2 {8×10^3kgf/mm^2},
$w=76.93\times10^{-6}$ N/mm^3 {7.85×10^{-6}kgf/mm^3} If both spring ends are either free or fixed, the natural primary frequency of a spring can be obtained as follows.

$$f_1=3.56\times10^5\frac{d}{NaD^2} \quad \cdots\cdots (13')$$

1.3.7 Other Points to Note

In spring design calculations, the following points should also be taken into account.

(1) Spring Index Excessive local stress can result from too small spring index. Machinability is compromised if the spring index is too great or small. The spring index should be selected from the range of 4~15 when hot forming, and from the range of 4~22 when cold forming.

(2) Slenderness Ratio In order to ensure the correct number of active winding, the slenderness ratio for a compression spring (Ratio of free height to coil mean diameter) should be 0.8 or greater. Furthermore, buckling considered, it is generally recommended that the slenderness ratio be selected from the range of 0.8~4 to prevent buckling.

(3) Number of Active Winding The number of active winding should be 3 or more in order to stabilize spring characteristics.

(4) Pitch Generally, when the pitch exceeds 0.5D, the spring deflection (load) increases to the extent that the coil diameter changes. This requires correction of the deflection and torsional stress values obtained by the basic formulae. Therefore, the pitch should be 0.5D or smaller. The pitch can generally be estimated using the following simplified formula.

$$p=\frac{L-H_s}{N_a}+d \quad \cdots\cdots (14)$$

Technical Data

Designing of Chain Drive Mechanism 1

Selection of Power Transmission Efficiency

The table of transmission performance in this catalog (**P. 235**) is based on the following conditions.

1) The chain drive mechanism is run in an atmosphere with a temperature of -10˚C~+60˚C and with no abrasive particles.
2) There is no adverse impact on the mechanism, such as corrosive gas or high humidity.
3) The two shafts between which power is transmitted are parallel with each other and correctly installed.
4) The recommended lubrication method and oil are used.
5) The power transmission is subjected to minimum load variation.

■ Power Transmission Coefficient for Multiple Chains

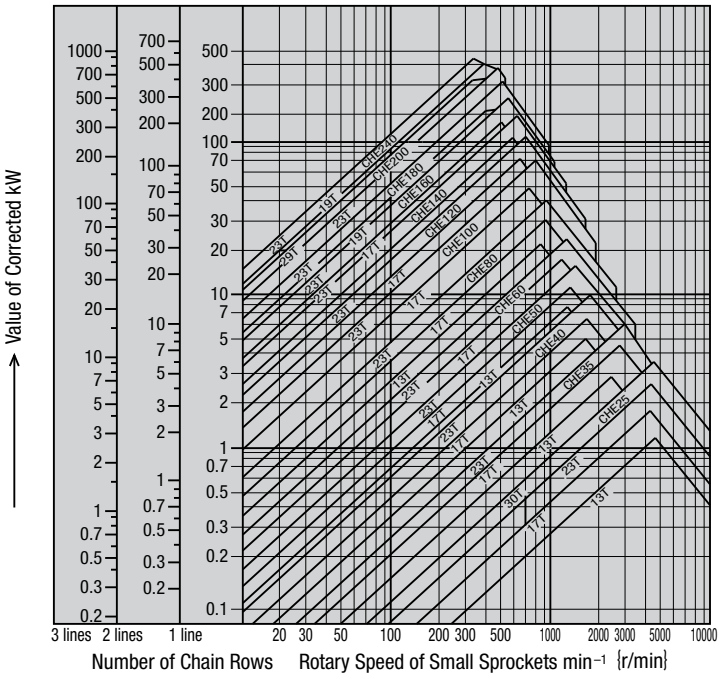
On multiple roller chains, the load is not shared evenly between each chain row. Therefore, the power transmission efficiency of multiple roller chains cannot be obtained by simply multiplying the power transmission efficiency of a single chain by the number of chain rows. The power transmission efficiency of multiple roller chains should be obtained by multiplying the power transmission efficiency of a single chain by the multiple chain power transmission coefficient.

Table 2. Power Transmission Coefficient for Multiple Chains

Number of Roller Chain Rows	Multiple Row Coefficient
2 lines	x1.7
3 lines	x2.5
4 lines	x3.3
5 lines	x3.9
6 lines	x4.6

■ Selection Guide Table

Table 3. Selection Guide Table



■ Application Coefficient Table

The power transmission efficiency table (**P. 235**) is based on minimum load variation. The transmitted kW shown in the table should be corrected as follows depending on the actual magnitude of load variation.

Table 1. Application Coefficient Table

Impact Type	Prime Motor Type Typical	Turbine Motor	Internal Combustion Engine	
			With Fluidic Mechanism	Without Fluidic Mechanism
Smooth Transmission	Belt conveyor with small load variation, Chain conveyor, Centrifugal pump, Centrifugal blower, General textile machinery, General machinery with small load variation.	x1.0	x1.0	x1.2
Transmission with Moderate Impact	Centrifugal compressor, Marine propeller, Conveyor with moderate load variation, Automatic furnace, Drier, Pulverizer, General machine tools, Compressor, General earth-moving machinery, General paper manufacturing machinery	x1.3	x1.2	x1.4
Transmission with Large Impact	Press, Crusher, Construction and mining machinery, Vibrator, Oil well digger, Rubber mixer, Roll, Rollgang, General machinery with reverse or impact load	x1.5	x1.4	x1.7

How to Read The Table

Ex. Corrected kW=5kW
Rotary Speed of Small Sprockets=300r/min
When single chain

The intersection point of the vertical axis (corrected kW) and the horizontal axis (rotary speed 300r/min) is below CHE 60 23T (23 toothed) and above 17T (17 toothed) A closer look at the location of the intersection point indicates that it most probably corresponds to 19T.

■ Specification Selection for Operation Under Normal Conditions

1.Operating Conditions

When selecting roller chains, the following 7 parameters should be taken into account.

1. Machine to be used
2. Impact Type
3. Prime Motor Type
4. Power Transmission(kW)
5. Diameter and Rotary Speed of High-Speed Shaft
6. Diameter and Rotary Speed of Low-Speed Shaft
7. Inter-Shaft Distance

2. Application Coefficient

Select the application coefficient from the application table (Table 1) that is appropriate for the machine to be driven and the prime motor type.

3. Corrected Power Transmission(kW)

Correct the power transmission(kW)using the application coefficient.

- Single Chain…Corrected Power Transmission(kW)=Power Transmission(kW)×Application Coefficient
- Multiple Chains…Select the appropriate coefficient from the table multiple-chain power transmission coefficients (Table 2).

$$\text{Corrected Power Transmission(kW)} = \frac{\text{Power Transmission(kW)} \times \text{Application Coefficient}}{\text{Multiple Row Coefficient}}$$

4. Chain and Number of Sprocket Teeth

Using the selection guide table(Table 3)or the power transmission efficiency tables, select the chain and the number of small sprocket teeth that satisfy the rotary speed of the high-speed shaft and the corrected power transmission(kW). The chain pitch should be as small as possible, as long as the required power transmission efficiency is achieved. This should minimize noise and ensure smooth transmission of power. (If a single chain does not provide the required power transmission efficiency, use multiple chains instead. If the installation space requires that the inter-shaft distance as well as the outer diameter of sprocket be minimized, use small-pitch multiple chains.) There should be a minimum wrap angle of 120° between the small sprocket and the chain.

5. Number of Large Sprocket Teeth

Number of Large Sprocket Teeth = Number of Small Sprocket Teeth × Speed Ratio Once the number of small sprocket teeth is determined, multiplying this by the speed ratio provides the number of large sprocket teeth. Generally, the appropriate number of small sprocket teeth is 17 or greater, or 21 or greater for high-speed operation, or 12 or greater for low speed operation. The number of large sprocket teeth should be 120 or less.Select the sprocket with as great a number of teeth as possible for a speed ratio of 1:1 or 2:1. The speed ratio should normally be 1:7 or less, and ideally 1:5.

6. Shaft Diameter

Ensure that the small sprocket selected as above is compatible with the diameter of the existing shaft on which it is to be installed. Refer to the specification table on this page. When the shaft diameter is too large for the bore in the sprocket, select another sprocket with a greater number of teeth or a larger chain.

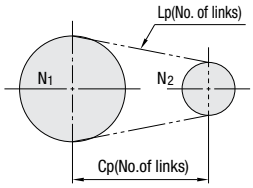
7. Inter-shaft Distance between Sprockets

The distance between the shafts can be reduced as long as the sprockets do not interfere with each other and the wrap angle between the small sprocket and the chain is 120° or more.

Generally, the inter-shaft distance should preferably be 30~50 times the pitch of the chain used. Under pulsating load conditions, decrease the distance to 20 times the chain pitch or less.

8. Chain Length and Distance between Shaft Centers

Once the chain, the number of teeth on both sprockets, and the inter-shaft distance are available, determine the number of chain links as follows.



Lp:Chain Length Expressed in Number of Links

N_1 : Number of Large Sprocket Teeth
N_2 : Number of Small Sprocket Teeth
Cp: Distance between Shaft Centers Expressed in Number of Links
π : ≈3.14

(1) Calculating the chain length (when the number of sprocket teeth N_1 and N_2 and the distance between shaft centers Cp are available)

$$Lp = \frac{N_1+N_2}{2} + 2Cp + \frac{\left(\frac{N_1-N_2}{2\pi}\right)^2}{Cp}$$

*Round up decimals of Lp to the next whole number.

Generally, when the chain length number of chain links obtained is an odd number, this should be raised to the next even number. When the inter-shaft distance demands the chain length to be an odd number, an offset link needs to be used. However, it should be avoided and an even number should be used as much as possible by adjusting the number of sprocket teeth or the inter-shaft distance.

(2) Calculating the distance between shaft centers (when the number of sprocket teeth N_1,and N_2 as the chain length Lp are available)

$$Cp = \frac{1}{8}\left\{ 2Lp - N_1 - N_2 + \sqrt{(2Lp - N_1 - N_2)^2 - \frac{8}{\pi^2}(N_1 - N_2)^2} \right\}$$

The pitch number obtained by the chain length formula is, in most cases, only approximate and not in exact agreement with a given inter-shaft distance. Therefore, it will be necessary to calculate the exact distance between the shaft centers based on the required overall length.

■ Example of Selection for Operation Under Normal Conditions

The following is an example of selection when a 3.7 kW 1,000r/min electric (motor) is used to drive a compressor.

[1] Operating Conditions

1) Machine to be used ····· Compressor, 10 hours operation
2) Impact Type ····· Smooth Transmission
3) Prime Motor Type ····· Electric Motor
4) Power Transmission ····· 3.7kW
5) Rotary Speed ····· 1000r/min

[2] Application Coefficient
From Table 1, an application coefficient of 1.2 is selected.

[3] Corrected Power Transmission(kW)
Corrected Power Transmission(kW)=Power Transmission(kW)×Application Coefficien
=3.7kW×1.2=4.44kW

[4] Chain and Number of Sprocket Teeth
Searching the selection guide table (Table 3) for a combination of 1,000 r/min and 4.44 kW provides a CHE40 chain and 17T sprocket.
On the power transmission efficiency table for the CHE40 chain, a combination of 13T and 1,000r/min provides a power transmission efficiency of 4.09 kW, which does not meet the required 4.44 kW. Therefore, 19T, which achieves 4.6 kW, should be selected to meet the requirement.
Results The CHE40 chain should be selected.
Number of Small Sprocket Teeth=19T

Technical Data

Designing of Chain Drive Mechanism 2

■ Specification Selection for Low-Speed Operation

In operations using a chain speed of 50 m/min. or less, chain elongation due to wear can almost be ignored. Under such low-speed conditions, the service life of the chain largely depends on its fatigue strength. Low-speed operation is more economical than operation under "normal conditions". Low speed is recommended for operations with fewer startups and stops that enable smooth power transmission. Selection of ambient atmosphere, layout, lubrication, etc. for low-speed operation is the same as that for operation under normal conditions. Selection should be made in accordance with the following formula.

Max. Allowable Tension of Chain	≥	Max. Tension N Working on Chain	x	Application Coefficient (Table 1) **P. 232**	x	Speed Coefficient (Table 4)

Table 4. Speed Coefficients

Roller Chain Speed	Speed Coefficient
0~15 m/min	1.0
15~30	1.2
30~50	1.4
50~70	1.6

[1] Operating Conditions
Same as for "Specifications Selection for Operation under Normal Conditions"

[2] Chain and Number of Small Sprocket Teeth
From the selection guide table 3 (**P. 232**), select a chain and a sprocket slightly undersized for the rotary speed (r/min) and the prime mover (kW) used.

[3] Calculating the Chain Speed
Based on the sprocket selected(chain pitch, number of teeth)and the number of revolutions (r/min), calculate the chain speed as follows.

$$V = \frac{P \cdot N \cdot n}{1000} \text{ (m/min)}$$

V : Chain Speed(m/min)
P: Chain Pitch(mm)
N: Number of Sprocket Teeth
n : Rotary of Sprocket Teeth(r/min)

[4] Calculating the Max. Working Load on Chain
Calculating the Maximum Working Load on the Chain

$$F = \frac{60 \cdot kW}{V} \text{ (kN)}$$

F : Load on Chain(kN)
V : Chain Speed(m/min)
kW: Power Transmission(kW)

[5] Application Coefficient
From the application coefficient table (Table 1), select the appropriate coefficient.

[6] Speed Coefficient
Based on the chain speed obtained in [3] above, calculate the appropriate speed coefficient.

[7] Maximum Allowable Tension of Chain
In the formula, substitute the values obtained in [4]~[6] above as well as the maximum allowable tension (obtained from actual products) for the chain selected in [2] above. Check whether these values satisfy the formula. If not, try again with another chain and sprocket set.

[8] Number of Large Sprocket Teeth, Shaft Diameter, and Chain Length same as for "Specification Selection for Operation under Normal Conditions".

■ Specification Selection for Low-Speed Operation with Impact Load

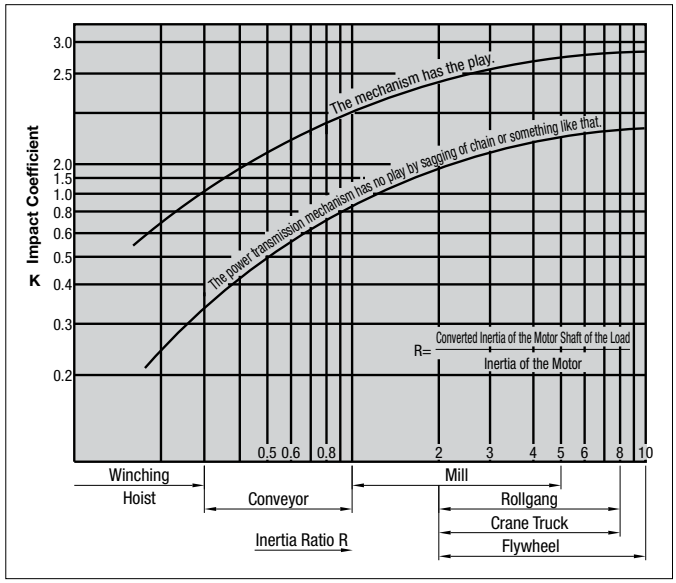
In operations with a great amount of impact loading due to frequent startups, stops, reversing, or braking, the inertia (GD^2) of the prime mover and the driven machine needs to be taken into account.
Under such conditions, exercise extreme caution, as the chain can be subjected to loads much greater than in operation under normal conditions.
Select the chain using the following formula.

Max. Allowable Load of Chain N	≥	Load Acting on Chain as Calculated from the Starting Torque of the Prime Mover	x	Impact	x	Speed

Impact Coefficient

This is a constant, shown in (Table 5), determined by the ratio of inertia (GD^2) of prime mover to driven machine as well as the magnitude of play in the power transmission mechanism used. When the power transmission mechanism has excessive play, it loads greater impact than those in the table can result.

Table 5. Impact Coefficient



■ Selection of Stainless Roller Chains (CHES)

Selection of stainless roller chains follows the specification selection for low-speed operation.

1). The maximum allowable tension for CHES (stainless type) is lower than that for CHE (steel type).

2). Avoid using offset links as much as possible.

■ Selection Based on Temperature

Selection of Roller Chains Based on Temperature

The following table shows selection criteria for roller chains by size based on temperature and the associated reduction in strength.

1) Problems associated with roller chain operation at high temperature
   (1) Reduced hardness and resultant increase in wear
   (2) Elongation due to softening
   (3) Poor lubrication and flexing and wear increase due to oil deterioration and carbonization
   (4) Wear increase and poor flexing due to scale
2) Problems associated with roller chain operation at low temperature
   (1) Low-temperature brittleness and resultant reduction in impact strength
   (2) Solidification of lubricating oil
   (3) Poor flexing due to attachment of frost and ice

Guide Table for Roller Chain Power Transmission Efficiency at High, Low Temperature

Temperature	CHE Roller Chain	
	CHE60 or Less	CHE80 or Above
-60˚C or below	—	—
-60˚C ~ -50˚C	—	—
-50˚C ~ -40˚C	—	Cannot Be Used
-40˚C ~ -30˚C	Cannot Be Used	Catalog Value×1/4
-30˚C ~ -20˚C	Catalog Value×1/4	Catalog Value×1/3
-20˚C ~ -10˚C	Catalog Value×1/3	Catalog Value×1/2
-10˚C ~ 60˚C	Catalog Value	Catalog Value
60˚C ~ -150˚C	Catalog Value	Catalog Value
150˚C ~ 200˚C	Catalog Value×3/4	Catalog Value×3/4
200˚C ~ 250˚C	Catalog Value×1/2	Catalog Value×1/2
Above 250˚C	Cannot Be Used	Cannot Be Used

Selection of Stainless Roller Chains for High-Temperature Operation

(1) Follow the specification selection for low-speed operation up to 400˚C.
(Do not use the specification selection method for operation under normal conditions.)
(2) Above 400˚C, use the temperature coefficient described below.
(3) Formula

Max. Working Load on Chain × Application Coefficient (Table 1) × Speed Coefficient (Table 4) × Temperature Coefficient (Kt) ≤ Max. Allowable Tension of Chain

Temperature Coefficient (Kt)

Temperature	Coefficient (Kt)
400˚C Less	1.0
400˚C ~ 500˚C	1.2
500˚C ~ 600˚C	1.5
600˚C ~ 700˚C	1.8
Above 700˚C	Cannot Be Used

Take account of corrosion resistance, which begins to decline above 400˚C.

■ Power and Torque

1kW=102kgf·m/sec 1PS=735.5W(Metric Power)
1kW=1000W 1HP=745.7W(Imperial Power) } ≈750W

*Torque :1kg·m=100kg·cm
1kg·m=9.8N·m (newton metre)
1N·m=0.120kg·m
1r/min =1rpm

Obtaining Power from Torque and Rotary Speed

$$\text{Output (kW)} = \frac{\text{Torque((N·m)} \times \text{ Rotary speed(r/min)}}{9.55 \times 1000}$$

CHE35 (Single Chain)

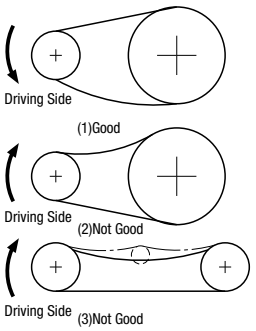
Installation Way

(A) Arrangement of Shafts

Horizontal Arrangement

Even when the shafts are arranged horizontally, the following points should be taken into account in terms of the rotary direction of the shafts. In (2) and (3) shown, elongation of the chain may prevent the chain links from leaving the sprocket teeth smoothly, resulting in biting. In (3) shown, the load bottom and slack top sides of the chain may come into contact with each other; to prevent this, use an idler or something equivalent.

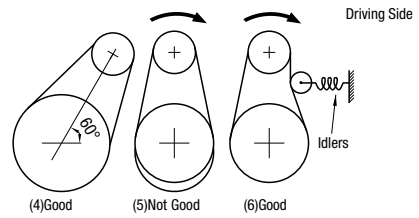
Horizontal Arrangement



Vertical Arrangement

In (5) shown, an elongated chain may sag below the bottom sprockets. In this case, when a small sprocket is arranged below a large sprocket, the elongated chain may drop away from the small sprocket. To prevent this, the shafts should be arranged as in (4) , maintaining the angle at a maximum of 60°. When the mechanism in question or the installation space requires a vertical arrangement, place the small sprocket above the large sprocket and use an idler, etc. on the outside or inside as shown in (6) .

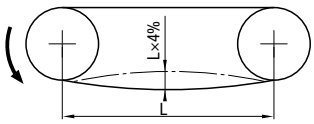
Vertical Arrangement



(B) Deflection

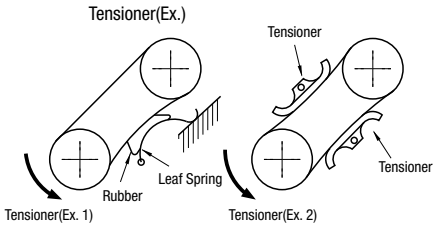
The deflection should normally be maintained at approximately 4% of the distance between the shafts, and approximately 2% in the following instances.

A. The shafts are arranged almost vertical transmission.
B. The distance between the shafts is 1 m or more.
C. The chain needs to be started and stopped frequently under heavy load.
D. The chain needs to be run in the reverse direction.



(C) Load Fluctuation

When the load varies during operation, install an initial tension either on the load or loose side of the chain. This can remove vibration and reduce the noise of the chain.



Lubrication

The service life of roller chains depends heavily on lubrication. Therefore, correct lubrication is extremely important. Today, as chains are increasingly run at higher speeds, they need to be lubricated more efficiently.

Benefits of Lubrication Oil

Oil applied into the space between pins, bushings and rollers forms oil film. Which then helps reduce wear of parts as well as absorb impact. Oil also cools down heat generated in the chain. Use good quality mineral oil to lubricate roller chains.

Recommended Lubricating Oil

Lubrication Method	A , B				C			
Temperature (℃) / Chain No.	-10 ~ 0	0 ~ 40	40 ~ 50	50 ~ 60	-10 ~ 0	0 ~ 40	40 ~ 50	50 ~ 60
CHE25~50	SAE10	SAE20	SAE30	SAE40	SAE10	SAE20	SAE30	SAE40
CHE60~80	SAE20	SAE30	SAE40	SAE50				

The lubrication methods

(mentioned in the power transmission efficiency tables are based on the followings.)

Lubrication	Method	Service Interval and Oiling Quantity	Notes
A	Hand Oiling 	Apply oil by hand using a hand oiler or a brush, normally at least once everyday.	While slowly turning the chain, apply oil evenly 3~4 times onto the entire length of the chain. Be careful not to allow hands or clothing to be caught between the chain and the sprocket. When the mechanism is run for the first time after oiling, be careful to excess oil splashing over.
	Drop Lubrication 	Oil the chain in a manner such that approximately 5~20 drops of oil are applied onto the chain per minute.	It is recommended that a simple casing be installed over the chain to prevent oil from splashing over.
B	Oil Bath Lubrication 	Dip the bottom of the chain approximately 10 mm below the oiled surface.	Use a leak-free oil container. Before installing the oil container, wash it carefully to remove dust, dirt and other foreign particles. Maintain the correct oil level. Do not overfill the container.
	Rotating Plate Lubrication 	The chain is oiled by a rotating plate. Dip the plate approximately 20mm below the oil level. The wind velocity of the plate should be 200 m/min or faster.	
C	Forced Circulation Lubrication by Pump 	It is necessary to adjust the oil quantity appropriately to prevent overheating.	Use a leak-free oil container. Before installing the oil container, wash it carefully to remove dust, dirt and other foreign particles.

Technical Data

Free Flow Chain / Table Top Chain Selection

■ Selection Procedure for Free Flow Conveyor Chains

[Step 1] Confirm Usage Condition

Confirm that the following conditions are true.

Temp.: -10°C ~ +80°c

Chain Velocity: 5~15m/min

Conveyor Length: 15m or less

Environment: No abrasive dusts, corrosive gasses, or high humidity

[Step 2] Finalize Chain Selection

Calculate Transferred Item Mass per 1m, and select a chain satisfying the Allowable Load Mass from the table below.

$WA(kg/m)=(W_1+W_2)/P_L$ WA: Transferred Item Mass per 1m (kgf)

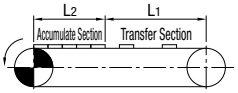
W_1: Workpiece Mass (kgf) W_2: Pallet Mass (kgf)

P_L: Pallet Move Distance (m)

Table 1. Allowable Load Mass

Chain	Allowable Load Mass (kgf/m)
WCHE3	30
WCHE4	55
WCHE5	55

[Step 3] Confirm Allowable Tension



$T=G/1000\times(Hw+Cw)L_1 \cdot fc+Aw \cdot L_2 \cdot fa+(Aw+Cw)L_2 \cdot fr+1.1Cw(L_1+L_2) \cdot fc$

T: Max. Tension Applied on Chain (kN)

L_1: Transfer Section Length (m)

L_2: Accumulation Section Length (m)

Hw: Transfer Section Transferred Mass including pallets (kg/m)

Aw: Accumulation Section Transferred Mass including pallets (kg/m)

Cw: Chain Weight (kg/m)

fa: Friction Coefficient of Transferred Item and Chain During Accumulation

fc: Friction Coefficient of Chain and Rail

fr: Friction Coefficient of Chain and Rail During Accumulation

G: Gravitational Acceleration=9.80665 (m/s^2)

Table 2. Friction Coefficient of Free Flow Conveyor Chains

Chain	Friction Coefficient
fa	0.10
fc	0.08
fr	0.20

(T) Max. Tension Applied on Chain is multiplied with (Table 3. K_1) Velocity Factor and (Table 4. K_2) Transferred Item Load Factor.

Tension per single chain is calculated (Two chains typically used for free-flow conveyors).

Allowable Chain Tension $\geq (T\times K_1\times K_2)/2$

If the calculated result exceeds the allowable tension of selected chain, re-select a chain one size larger or re-calculate with conveyor length divided into shorter sections.

Table 3. Velocity Factor Table

Chain Velocity m/min.	Factor K_1
1~4 or less	1.0
Over 4, 8 or less	1.1
Over 8, 10 or less	1.2
Over 10, 14 or less	1.5
Over 14, 18 or less	1.6

Table 4. Transferred Item Load Factor

Average Transferred Item Weight Wa (kg/m)	Factor K_2
30 or Less	1.00
31~40	1.10
41~50	1.15
51~70	1.20
71~90	1.25
91~120	1.35

Table 5. Max. Allowable Tension for Free Flow Conveyor Chains

Chain Velocity m/min.	Allowable Tension (kN)
WCHE3	0.55
WCHE4	0.88
WCHE5	1.37

■ Selection Procedure for Table Top Conveyor Chains

[Step 1] Calculate Effective Tension (Fe)

$Fe=g \cdot (m \cdot Lc \cdot \mu R + (m + M) \cdot (Lc-A) \cdot \mu R + MA \cdot A \cdot (\mu c + \mu R)+m \cdot A \cdot \mu R)$

Fe: Effective Tension (N)

Lc: Conveyor Length (m)

A: Accumulation Span Length (m)

* A=0 when there is no Accumulation.

M: Mass of Transferred Item

MA: Mass of Transferred Item for Accumulation Section

m: Chain Mass (kg/m)

μc: Dynamic Friction Coefficient of Chain and Transferred Item

μR: Dynamic Friction Coefficient of Chain and Rail

g: Gravitational Acceleration=9.80665 (m/sec^2)

Table 1. Friction Coefficient

Lubrication Method	Material of Transferred Item				
	Steel	Aluminum	Glass	Paper	Plastic
Dry	0.25	0.2	0.15	0.3	0.2
Soap Water	0.15	0.12	0.1	—	0.15

Lubrication Method	Gide Rail Material			
	Steel	Stainless	UHMW	Nylon
Dry	0.2	0.2	0.15	0.2
Soap Water	0.12	0.12	0.1	0.14

*The Friction Coefficients above are estimated values with safety ratio added, for use as tension calculation components.

[Step 2] Calculate Post-adjusted Tension based on conditions

$Fs=Fe \cdot Cs$

Fs: Post-adjusted Tension (N)

Cs: Load Correction Factor

For frequent starts and stops	=1.2
For wear intensive applications	=1.2
For multiple row use	=1.25
For other than above	=1.0

[Step 3] Calculate Chain Allowable Tension

$Fadm=FN \cdot Va \cdot Ta$ Fadm: Allowable Tension (N)

FN: Max. Allowable Tension (N) Va: Velocity Factor

Ta: Temperature Factor

Table 2. Maximum Allowable Tension

Type	Nomial	Max. Allowable Tension (N)
TPCH	826 1143	1650

Table 3. Velocity Factor

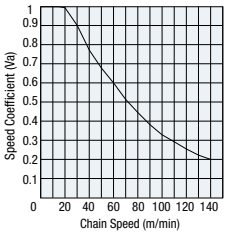


Table 4. Temperature Factor

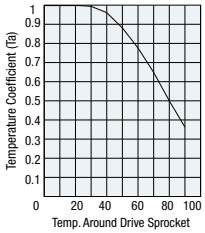


[Step 4] Compare Allowable Tension and Post-adjusted Tension

If Fs≤Fadm, the selection is applicable.

[Step 5] Calculating Required Power

$P=Fs \cdot V/(60 \cdot \eta)$ P: Required Power (W)

V: Chain Velocity (m/min) η: Transmission Efficiency

Technical Data

Selection of Flat Belts

Allowable Stress for Tension Member

Check the belt that is selected for allowable stress, using the following procedures.

1. Calculating the Effective Tension

Formula 1 $F=f(W_G+W_1+W_2)L+f(W_1+W_3)L\pm W_G \cdot H$

(Carrier Side) (Return Side) (Vertical Side)

F: Effective Tension

f: Rolling friction coefficient of rollers, or friction coefficient between belt and supports (Select from Table 1.)

$_{\omega}$G: Weight of Carried Materials per Meter of Belt kg/m

$_{\omega}$1: Weight of belt per Meter kg/m

$_{\omega}$2: Carrier Roller Weight per 1m kg/m (Select from Table 2.)

$_{\omega}$3: Return Roller Weight per 1m kg/m (Select from Table 2.)

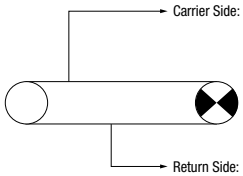
L: Conveyor Horizontal Length m

H: Vertical Height (+Up angle, -Down angle) m

Table 1. Table of f Values

Belt Surface in Contact with Supports	Smooth	Cloth Surfaced
Roller Support	0.05	0.05
Roller+Steel Plate Support	0.2	0.3
Steel Supported (SUS·SS)	0.4	0.5
Plywood Support	0.5	0.6

(When knife edges are used, add 0.2 to the above values in Table 1.)



Carrier Side: As the back of the belt has a cloth surface, avoid using iron plate or plywood as support as much as possible.

Return Side: When the front side of the belt has a cloth surface, or is coated with silicon or fluorocarbon resin, avoid using iron plate or plywood as support as much as possible. (Some types of belts identified by specific product names are compatible with the roller, table.)

Table 2. Table of Roller Weight

Roller Dia. (mm)	Single Roller (kg/roller)	Allowable Load (kg/roller)
28.6	0.2	50

Table 2. shows the weight of the revolving parts of a roller that meets (JISB8805-1965). For accurate calculation, check the actual weight of the roller being used.

2. Power Requirement

Formula 2 $P=\frac{F \cdot V}{60000}$

P: Power Requirement kW
F: Effective Tension N
V: Belt Speed m/min
60000: 60×102 (Constant)

3. Motor Power

Formula 3 $Pm=\frac{P}{\eta}$

Pm: Motor Power kW
P: Power Requirement kW
η: Mechanical Efficiency
(Standard Mechanical Efficiency Range: 0.5~0.65)

For efficient operation, it is recommended to check the motor property if the motor for use has a power rating less than 0.1kW.

4. Using the Tension on the Loose Side to Calculate Maximum Tension

Formula 4 $F_{M1}=F \cdot K$

F_{M1}: Maximum Tension N
F: Effective Tension N
K: Coefficient

Using Value μ selected from Table-3 and the wrap angle (θ), select value K from Table 4. (When the wrap angle (θ) is not listed in Table 4, Calculate from)

$K=\frac{e^{\mu\theta_1}}{e^{\mu\theta_1}-1}$

μ: Friction coefficient between driving pulley and belt (Select from Table 3.)
e: Base of Natural Logarithm (2.718)
θ': Radian ($\theta'=\theta\times\frac{2\pi}{360}$)

Table 3. List of μ values

Pulley Surface \ Surface Shape in Contact with Pulley		Smooth	Cloth Surfaced
Bare Steel Pulley	Dry	0.2	0.3
	Wet	0.15	0.2
Rubber Ranking Pulley	Dry	0.3	0.35
	Wet	0.2	0.25

Table 4. Table of Value K Based on Wrap Angle (θ)

θ° \ μ	0.1	0.15	0.2	0.25	0.3	0.35	0.5
180	3.8	2.7	2.2	1.9	1.7	1.5	1.3
190	3.6	2.6	2.1	1.8	1.6	1.5	1.3
200	3.4	2.5	2.0	1.8	1.6	1.5	1.3
210	3.3	2.4	2.0	1.7	1.5	1.4	1.2
220	3.2	2.3	1.9	1.7	1.5	1.4	1.2
230	3.1	2.3	1.9	1.6	1.4	1.4	1.2

5. Using Pretension to Calculate Maximum Tension

Formula 5 $F_{M2}=F+B \cdot T_C$

FM2: Maximum Tension N
B: Belt Width cm
TC: Initial Tension N/cm
(Select from Table 5.)

Table 5. Table of Tc Values

No. of Tension Members (No. of Plys)	1 Pc.
Initial Tension (N/cm)	1.5

Compare F_{M1} (Formula 4) and F_{M2} (Formula 5), and Make the larger as the Max. Tension FM.

6. Allowable Stress

Formula 6 $C\geq\frac{F_M}{B}$

C: Allowable Stress for Belt N/cm
FM: Effective Tension kg
B: Belt Width cm

When the allowable stress for the belt being used is equal to or higher than the maximum tension per 1cm width of the belt as expressed by Formula 6 above, the belt is suitable for use.

Technical Data

Selection of Timing Belts 1

[Step 1] Setting the Required Design Conditions

(1) Machine Type (2) Power Transmission (3) Load Variances (4) Operation Duration per Day (5) Small Pulley Rotational Speed
(6) Rotation Ratio (Lg. Pulley # of Teeth / Small Pulley # of Teeth) (7) Shaft Center Distance (Interim) (8) Pulley Diameter Limitation (9) Other Usage Conditions

[Step 2a] Calculating Design Power……MXL/XL/L/H/S_M/MTS_M/T Series

- Design Power (Pd) =Transmission Power (Pt) x Overload Factor (Ks)
- Calculate Transmission Power at Motor Rated Power Output. (Ideally should be calculated with the load applied to the belt)
- Overload Factor (Ks)=Ko+Kr+Ki Overload Factor (Ks)=Lo+Kr+Ki Ko: Overload Correction Factor (Table 1.) Kr: Rotation Ratio Correction Factor (Table 2.) Ki: Idler Correction Factor (Table 3.)

Table 1. Load Correction Factor (Ko)

Typical Machines Using a Belt	Motor					
	Max. Output not Exceeding 300% of Rated Value			Max. Output Exceeding 300% of Rated Value		
	AC Motor (Standard Motor, Synchronous Motor) DC Motor (Shunt), Engine with 2 or More Cylinders			Special Motor (High torque), Single-Cylinder Engine DC Motor (Series), Operation with Lye Shaft or Clutch		
	Operation Hours			Operation Hours		
	Intermittent use 1 Day 3 to 5 hrs	Regular Use 1 Day 8 to 12 hrs	Continuous Use 1 Day 8 to 12 hrs	Intermittent use 1 Day 3 to 5 hrs	Regular Use 1 Day 8 to 12 hrs	Continuous Use 1 Day 8 to 12 hrs
Exhibit Instrument, Projector, Measuring Instrument, Medical Machine	1.0	1.2	1.4	1.2	1.4	1.6
Cleaner, Sewing Machine, Office Machine, Carpentry Lathe, Belt Sawing Machine	1.2	1.4	1.6	1.4	1.6	1.8
Light Load Belt Conveyor, Packer, Sifter	1.3	1.5	1.7	1.5	1.7	1.9
Liquid Mixer, Drill Press, Lathe, Screw Machine, (Circular Sawing) Machine, Planer, Washing Machine, Paper Manufacturing Machine (Excluding Pulp Manufacturing Machine), Printing Machine	1.4	1.6	1.8	1.6	1.8	2.0
Mixer (Cement and Viscous Matter), Belt Conveyor (Ore, Coal and Sand), Grinder, Shaping Machine, Boring Machine, Milling Machine, Compressor (Centrifugal), Vibration Sifter, Textile Machine (Warper and Winder), Rotary Compressor, Compressor (Reciprocal)	1.5	1.7	1.9	1.7	1.9	2.1
Conveyor (Apron, Pan, Bucket and Elevator), Extraction, Fan, Blower (Centrifugal, Suction and Discharge), Power Generator, Exciter, Hoist, Elevator, Rubber Processor (Calender, Roll and Extruder), Textile Machine (Weaving Machine, Fine Spinning Machine, Twisting Machine and Weft Winding Machine)	1.6	1.8	2.0	1.8	2.0	2.2
Centrifugal Separator, Conveyor (Flight and Screw), Hammer Mill, Paper Manufacturing Machine (Pulpapitor)	1.7	1.9	2.1	1.9	2.1	2.3

- Typical machines using a belt are listed above. For other machines using a belt, a load correction coefficient should be fixed by reference to this table.
- In the case of starts and stops over 100 times per day or rapid acceleration and deceleration, check the above values multiplied by 1.3. (MTS_M only)

Table 2. Speed Ration Correction Coefficient (Kr)

Speed Ratio	Coefficient (Kr)
1.00 to 1.25	0
1.25 to 1.75	0.1
1.75 to 2.50	0.2
2.50 to 3.50	0.3
3.50 or more	0.4

Table 3. Idlers Correction Coefficient (Ki)

Position of Idler	Coefficient (Ki)
Inside the loose side of the belt	0
Outside the loose side of the belt	0.1
Inside the loose side of the belt	0.1
Outside the loose side of the belt	0.2

[Step 2b] Calculating Design Power ……For P_M/UP_M Series

- Design Power (Pd) =Transmission Power (Pt) x Overload Factor (Ks)
- Calculate Transmission Power at Motor Rated Power Output. (Ideally should be calculated with the load applied to the belt)
- Normal Motor Load Factor (Ks)=Ko+Ki+Kr+Kh
  Ko: Application Coefficient (Table 4.) Ki: Idler Correction Factor (Table 5.) Kr: Speed Multiplication Correction Factor (Table 6.) Kh: Operation Time Correction Factor (Table 7.)

Table 4. Application Coefficient (Ko)

Type of Passive Unit			Type of Motor / Peak Output/ Basic Output	Ⅰ 200% or Less	Ⅱ 200 to 300	Ⅲ 300% or More
A	Extremely Smooth Transmission			1.0	1.2	1.4
B	Fairly Smooth Transmission			1.3	1.5	1.7
C	Transmission with Moderate Impact			1.6	1.8	2.0
D	Transmission with Considerable Impact			1.8	2.0	2.2
E	Transmission with Large Impact			2.0	2.2	2.5
Motor	AC Motor	Single-Phase		—	—	All Types
		Squirrel-Cage Induction	2 Poles	100kW or More	90~3.7kW	2.2kW or Less
			4 Poles	55kW or More	45kW or Less	—
			6 Poles	37kW or More	30kW or Less	—
			8 Poles	15kW or More	11kW or Less	—
		Wire-Wound	4 Poles	—	15kW or Less	11kW or Less
			6 Poles	—	11kW or Less	7.5kW or Less
			8 Poles	—	5.5kW or Less	3.7kW or Less
		Synchronous Motor		—	Average Torque	High Torque
	DC Motor			Shunt	Compound	Series
	Internal Combustion Engine			8 or More Cylinders	7~5 Cylinders	4~2 Cylinders
	Hydraulic Motor			—	—	All Types

Note: When the transmission involves regular, reverse revolutions, large momentum or extreme impact, a basic-use coefficient of 2.5 or more can be used.

Type	Typical Passive Machines
A	Measuring Instrument, Camera Device, Radar, Medical Machine, Projector
B	Belt Conveyor (For Light Load), Chain Conveyor (For Light Load), Driller Press, Lathe, Screw Machine, Electric Typewriter, Calculator, Duplicator, Printing Press, Cutter, Paper Folder, Printer, Mixer, Calender-Dryer, Lathe, Belt Sawing Machine, Plane, Circular Sawing Machine, Planer, Mixer (Liquid), Bread Baking Machine, Flour Kneading Machine, Sifter (Drum and Cone), Sawing Machine
C	Belt Conveyor (Ore, Coal, Sand), Elevator, Boring Mill, Grinder, Milling Machine, Shaper, Metal Sawing Machine, Wind Hoist, Dryer, Washing Machine (Including a Wringer), Excavator, Mixer, Granulating Machine, Pump (Centrifugal, Gear and Rotary), Compressor (High-Speed Center), Stirrer, Mixer (Viscous Matter), Centrifugal Forced Blower, General Rubber Handling Machine, Power Generator, Sifter (Electric)
D	Conveyor (Apron, Bucket, Flight, Screw), Hoist, Cutting Press, Shattering Machine, Pulp Manufacturing Machine, Weaving Machine, Spinning Machine, Twisting Machine, Blender, Centrifugal Separator, Blower (Axial Flow, for Mining and Roots), General Construction Equipment, Hammer Mill, Rollgang
E	Crank Press, Pump (Reciprocal), Compressor (Reciprocating), Civil Engineering, Mining Equipment Including Crushing Machine (Ball, Rod, Gravel), Rubber Mixer

Table 5. Correction Coefficient when Idler is Used (Ki)

Location of Idler in Use	Inside	Outside
Loose Side of the Belt	0	+0.1
Tense Side of the Belt	+0.1	+0.2

Should be added for each idler.

Table 6. Speed Increase Correction Coefficient (Kr)

Speed Increase Ratio	Correction Coefficient
1 to 1.25	0
1.25 to 1.75	+0.1
1.75 to 2.5	+0.2
2.5 to 3.5	+0.3
3.5 or more	+0.4

Table 7. Operating Correction Coefficient (Kh)

Operation Hours	Correction Coefficient
Operated 10 or More Hours a Day	+0.1
Operated 20 or More Hours a Day	+0.2
Operated 500 Hours or Less (For Seasonal Operation)	–0.2

Selection is easy with Timing Pulleys and Belts automatic calculation tool available at: http://fawos.misumi.jp/FA_WEB/pulley_us/

[Step 2c] Calculating the Design Power……2GT/3GT Series

- Design Power (Pd) =Transmission Power (Pt) ×Overload Coefficient (Ks)
- Calculate the Transmission Power (Pt) in terms of the rated power of the prime motor. (Originally, it is ideal to calculate from the actual load applied to the belt)

A: Normal Motor Load Factor (Ks)=Ko+Ki+Kr+Kh

Ko: Load Correction Factor (Table 8) Ki: Idler Correction Factor (Table 9) Kr: Speed Multiplication Correction Factor (Table 10) Kh: Operation Time Correction Factor (Table 11)

B: Servo Motor Kp, other table*

Table 8. Load Correction Factor (Ko)

Type of Motor			Ⅰ	Ⅱ	Ⅲ
Peak Output/Basic Output			150% or Less	Over 150%~200% or Less	Over 250%
AC Motor	Single-Phase		—	—	All Types
	Squirrel Cage Type	2 Phase	—	—	All Types
		4 Phase	—	37Kw or More	30Kw or Less
		6 Phase · 8 Phase	—	—	All Types
	Wound Field Type	4 Phase	—	—	15Kw or Less
		6 Phase	—	—	11Kw or Less
		8 Phase	—	—	5.5Kw or Less
Synchronous Motor			—	Standard Torque Type	High Torque Type
DC Motor			Shunt	Wound Field	Series
Hydraulic Motor			—	—	All Types
Office Machinery	Printer · Fax Machine · Copy Machine		—	1.2	1.4
Home Appliance	Juicer		—	1.4	1.6
	Vacuum Cleaner		1.0	1.2	1.4
Finance Equipment	Money Exchanger · Ticket Machine · Ticket Gates · Bank Teller Machine		1.3	1.4	1.5
Food · Medicine · Medical Equipment	Bakery Equipment		1.2	1.4	1.6
	Mixer · Granulator		1.4	1.6	1.8

	Sawing Machine – Industrial		—	1.6	1.8
Belt Conveyor · Packaging Machine	Belt Conveyor – Light Objects		1.1	1.3	1.5
	Packaging Machine		1.2	1.4	1.6
Film · Wire Making Machine	Calender · Extruder		1.4	1.6	1.8
	Wire Making Machinery		1.4	1.6	1.8

Table 9. Idler Correction Factor (Ki)

Idler Position	Inside	Outside
Loose Side of the Belt	0	+0.1
Tense Side of the Belt	+0.1	+0.2

Table 10. Speed Multiplication Correction Factor (Kr)

Speed Increase Ratio	Correction Factor
1 or More Less than 1.25	0
1.25 or More Less than 1.75	+0.1
1.75 or More Less than 2.5	+0.2
2.5 or More Less than 3.5	+0.3
3.5 or More	+0.4

Table 11. Operation Time Correction Factor (Kh)

Operation Time	Correction Factor
Less than 10 hours (Everyday)	0
10~16 Hours Continuous (Everyday)	+0.2
16~24 Hours Continuous (Everyday)	+0.4
300 Hours/Year or Less (Seasonal operations etc.)	–0.2

Table 12. Special Motor Correction Factor (Kp)

Motor Type	Load Correction Factor
Servo Motor	Design as Kp=2.5 for Rated Output, and Kp=0.5 for Peak Output (Rational speed as applied speed)
Spindle Motor	Design as Kp=2.2 for Rated Output and Base Rotational Speed

[Step 2-d] Calculating Designed Power …… For EV5GT/EV8YU Series

- Design Power (Pd) =Transmission Power (Pt) x Overload Factor (Ks)
- Calculate Transmission Power at Motor Rated Power Output. (Ideally should be calculated with the load applied to the belt)
- Overload Factor (Ks)=Ko+Ki+Kr+Kh+Km

Ko: Load Correction Factor (Table 13) Ki: Idler Correction Factor (Table 14) Kr: Speed Multiplication Correction Factor (Table 15) Kh: Operation Time Correction Factor (Table 16) Km: Start/Stop Correction Factor (Table 17)

Table 13. Load Correction Factor (Ko)

Prime Motor Type		Induction Motor	Spindle Motor	Servo Motor (Peak Output/Rated Output)		
				200% or Less	201~299%	300% or More
Robot	Scara Type	2.0	2.0	1.6	1.7	1.8
Injection Mold Machine	Mold Fastening · Ball Screw Drive	1.8	1.8	1.3	1.4	1.5

501<	0.4

Technical Data

Selection of Timing Belts 2

[Step 3] Temporarily Selecting the Type of Belt from Selection Guide Table

Table 18. Selection Guide Table 1 (MXL,XL,L,H,T5,T10)

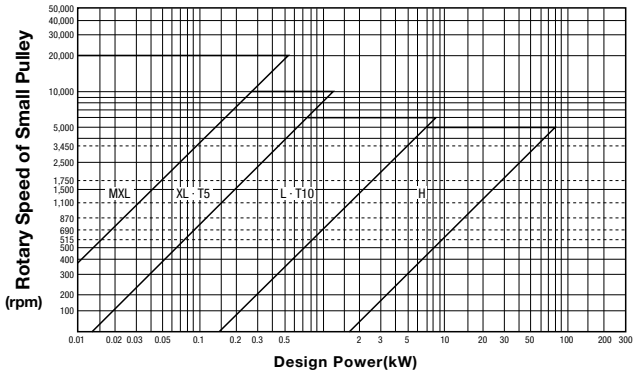

Table 19. Selection Guide Table 2 (S_M series)

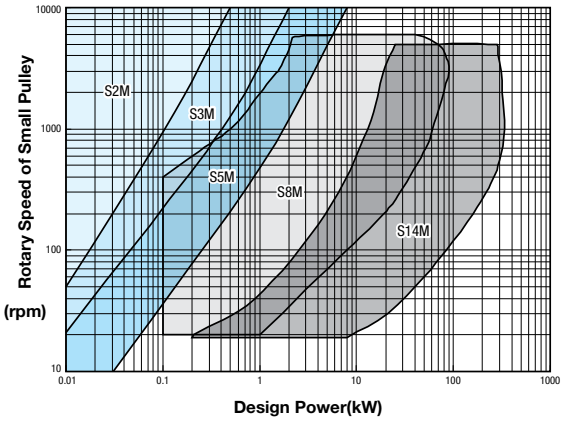

Table 20. Selection Guide Table 3 (P_M series)

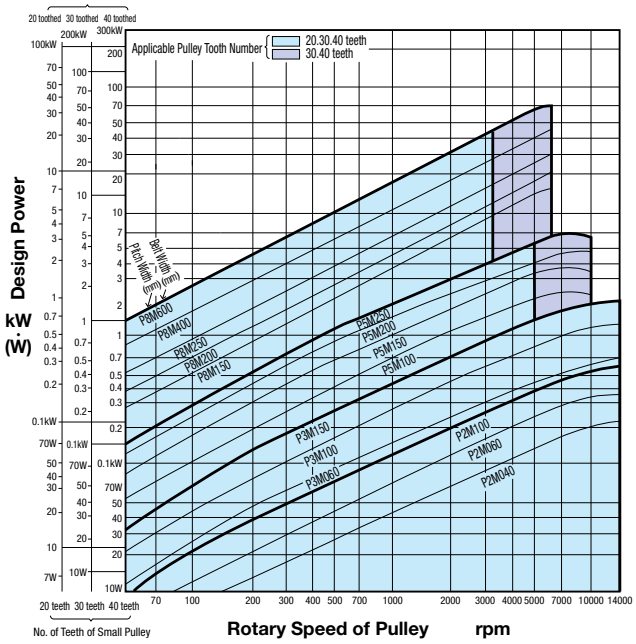

Table 21. Selection Guide Table 4 (MTS8M)

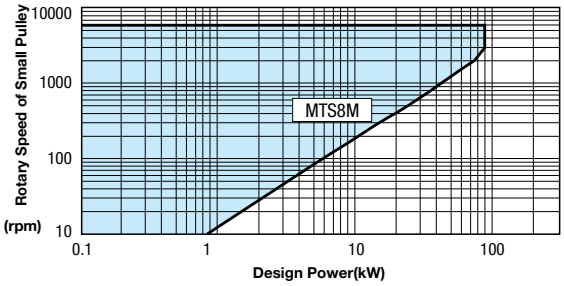

Table 22. Selection Guide Table 5 (UP_M series)

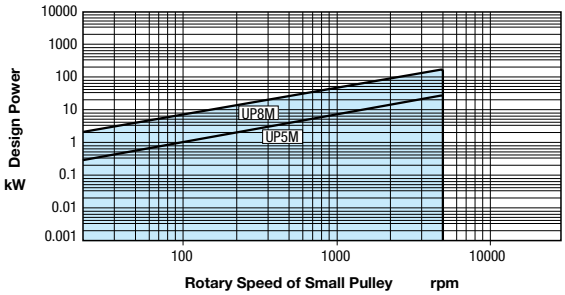

Table 23. Selection Guide Table (2GT·3GT series)

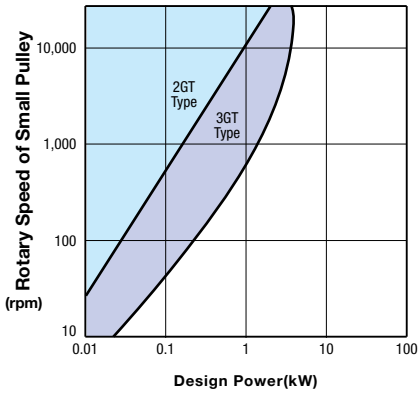

Table 24. Selection Guide Table (EV5GT·EV8YU series)

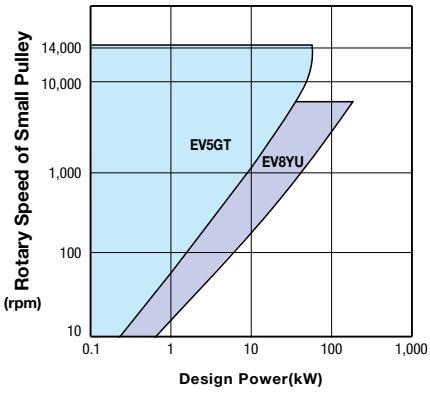

Selection is easy with Timing Pulleys and Belts automatic calculation tool available at: http://fawos.misumi.jp/FA_WEB/pulley_us/

[Step 4] Determining Number of Teeth of Large and Small Pulley, Belt Length, Inter-Shaft Distance

(1) Select the number of teeth of large and small pulley from **P. 248–258**, which can satisfy the predeterminated speed ratio.
(However, note that the number of teeth for small pulley should be larger than the min. number of teeth shown in Table 25.)

$$\text{Speed Ratio} = \frac{\text{Number of Teeth of Large Pulley}}{\text{Number of Teeth of Small Pulley}}$$

Table 25. Min. Number of Teeth of Pulley

Rotary Speed of Small Pulley (rpm)	Type of Belt, Minimum Number of Teeth											
	MXL	XL	L	H	S2M	S3M	S5M	S8M	S14M	MTS8M	T5	T10
900 or Less	12	10	12	14	14	14	14	22	—	24	12	14
Over 900 1200 or Less	12	10	12	16	14	14	16	24	34	24	12	16
Over 1200 1800 or Less	14	11	14	18	16	16	20	26	38	24	14	18
Over 1800 3600 or Less	16	12	16	20	18	18	24	28	40	24	16	20
Over 3600 4800 or Less	—	16	20	24	20	20	26	30	48	24	20	22
Over 4800 10000 or Less	—	—	—	—	20	20	26	—	—	—	—	—

(2) Determine approx. belt circum. length (Lp') in terms of temporary inter-shaft distance (C'), diameter of large pulley (Dp) and diameter of small pulley (dp).

$$Lp' = 2C' + \frac{\pi(Dp+dp)}{2} + \frac{(Dp-dp)^2}{4C'}$$

C' : Temporary Inter-shaft Distance
dp : Pitch Diameter of Small Pulley (mm)
Dp : Pitch Diameter of Large Pulley (mm)
Lp' : Approx. Belt Circum. Length (mm)

(3) Determine a belt circum. length (Lp') that is the nearest value to approx. belt circum. length referring to (select from actual product on the web), and then calculate the correct inter-shaft distance using the following formula.

$$C = \frac{b + \sqrt{b^2 - 8(Dp-dp)^2}}{8}$$

$$b = 2Lp - \pi(Dp+dp)$$

Dp : Pitch Diameter of Large Pulley (mm)
dp : Pitch Diameter of Small Pulley (mm)
C : Inter-shaft Distance
Lp : Belt Circum. Length (mm)

[Step 5] Determining Belt Width

(1) Calculate an approx. belt width using the following formula, and then select a belt width (Bw':mm) that is the nearest value to the approximated value.

$$Bw' = \frac{Pd}{Ps \cdot Km} \times Wp$$

Pd: Design Power
Ps: Reference Transmission Capacity .....Use the Reference Transmission Capacity Table on **P. 248–258**.
Km: Engagement Correction Coefficient (Table 26)
Wp: Reference Belt Width (Table 27.)

Table 26. Engagement Correction Coefficient (Km)

No. of Teeth Engaged Zm	More than 6	5	4	3	2
Km	1.0	0.8	0.6	0.4	0.2

$$\text{No. of Teeth Engaged (Zm)} = \frac{Zd \cdot \theta}{360°}$$

$$\theta = 180° - \frac{57.3(Dp-dp)}{C}$$

Zd: No.of Teeth of Small Pulley
θ : Contact Angle(°)
Dp: Pitch Diameter of Large Pulley(mm)
dp: Pitch Diameter of Small Pulley(mm)
C:Inter-shaft Distance(mm)

Table 27. Reference Belt Width (Wp)

Type of Belt	MXL	XL	L	H	S2M	S3M	S5M	S8M	S14M	MTS8M
Reference Belt Width	6.4	25.4	25.4	25.4	4	6	10	60	120	60

Type of Belt	P2M	P3M	P5M	P8M	T5	T10
Reference Belt Width	4	6	10	15	10	10

(2) Check if Design Power (Pd) satisfies the following formula. (If not, select the belt width of one size larger again.)

· Pd<Ps · Km · Kb
*2GT · 3GT · EV5GT · EV8YU
· Pd<Ps · Km · Kb · KL

Pd : Design Power
Ps : Reference Transmission Capacity
Km : Engagement Correction Coefficient
Kb : Width Correction Coefficient (Table 28)
KL : Length Correction Coefficient (Table 29)

Table 28. Width Correction Coefficient(Kb)

Type of Belt	Belt Width		Width Correction Coefficient
	Nominal	mm	Kb

■ Notes on Operation

1. Be careful to avoid the ingress of foreign particles.
   When solid foreign particles enter during operation, it can scratch the belt and adversely affect the engagement of the belt and the pulley.
   In some cases, the pulley may disengage, land on the teeth of the pulley, and be cut.

2. Avoid Adhesion of oil.
   Oil on the rubber timing belt may wet and expand it, drastically shortening its service life.
   (a) Take special care when using solvent type oil.
   (b) A small amount of lubricant or grease, however, rarely causes a trouble.

3. Do not use the belt in a humid atmosphere.

4. Please use a well-ventilated safety cover.

5. The service life of the belt, when used at a high temperature (80˚C or more), can be drastically shortened.

<Reference> Belt Width Tolerance (Unit: mm)

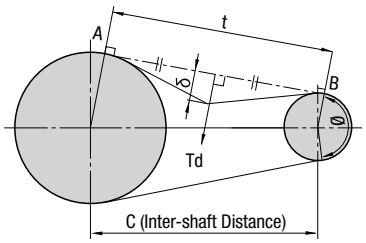
Belt Width	Belt Length			
	351 or Less	351 to 840	840 to 1680	1680 or More
10 or Less	+0.3 −0.6	+0.3 −0.6	+0.3 −0.6	+0.6 −0.6
10 to 40	+0.6 −0.6	+0.6 −0.6	+0.6 −0.6	+0.6 −0.6
40 to 50	+0.6 −0.6	+0.6 −0.6	+1.0 −1.0	+1.0 −1.3

Selection is easy with Timing Pulleys and Belts automatic calculation tool available at: http://fawos.misumi.jp/FA_WEB/pulley_us/

Cautions on Use of Belt

■ How to Extend Belt

When the belt is too taut, its service life can be shortened, while when it is not taut enough, the belt may (jump off) the groove of the pulley due to an activating torque or shock load. Keep the belt stationary and optimize its tautness. The warp load necessary to provide the optimum tautness can be calculated from values representing the belt, its width and the span in equation A below.



$$Td = \frac{Ti + \frac{t \times Y}{Lp}}{16} \quad \text{Equation A}$$

Td: Load N Needed for Deflection d at the Center of Span t

Ti : Initial Tension N — From Table 31

Y : Correction Coefficient — From Table 31

δ : Deflection (mm) — $\delta = 0.016t$

t : Span Length (mm) — $t = \sqrt{C^2 - \frac{(Dp-dp)^2}{4}}$

Lp : Length of the Belt (mm)

C : Inter-shaft Distance (mm)

dp : Diameter of the Pitch Circle of the Small Pulley (mm)

Dp : Diameter of the Pitch Circle of the Large Pulley (mm)

*[ ] The circumferential speed of pulley is 33(m/s)or more; a dynamic balance for the pulley is essential.

*Values in the table above are for nominal belt width 100 (25.4 mm). For other belt widths, those values should be multiplied by the width correction coefficient, Kb, shown in Table 28.

*Values in the table above are for 6mm belt width. For other belt widths, those values should be multiplied by the width correction coefficient, Kb, shown in Table 28.

Selection is easy with Timing Pulleys and Belts automatic calculation tool available at:
http://fawos.misumi.jp/FA_WEB/pulley_us/

* ☐ The circumferential speed of pulley is 33(m/s)or more; a dynamic balance for the pulley is essential. *Values in the table above are for 10mm belt width. For other belt widths, those values should be multiplied by the width correction coefficient, Kb, shown in Table 28.

*Because the durability in terms of hours decreases in the ☐ marked range, this range should be avoided whenever possible. * ☐ The circumferential speed of pulley is 33(m/s)or more; a dynamic balance for the pulley is essential. *Values in the table above are for 60mm belt width. For other belt widths, those values should be multiplied by the width correction coefficient, Kb, shown in Table 28.

Technical Data

Selection of Timing Belts 6 – Transmission Capacity Table –

Table 40. Reference Transmission Capacity of S14M Ps – Belt Width 120mm – (kW)

*Because the durability in terms of hours decreases in the [ ] marked range, this range should be avoided whenever possible.
*The circumferential speed of pulley is 33 (m/s) or more in the [ ] marked range; a dymanic balance for the pulley is essential.
*The [ ] marked range should be avoided whenever possible, as above two factors overlap here.*Values in the table above is for nominal belt width 120 (120mm). For other belt widths, these values should be multiplied by the width correction coefficient in Table 28.

Table 41. Reference Transmission Capacity of MTS8M Ps – Belt Width 60mm – (kW)

Rotary Speed of Small Pulley(rpm) \ Number of Teeth of the Pulley(T) / Pitch Dia.(mm)	24 / 61.12	26 / 66.21	28 / 71.30	30 / 76.39	32 / 81.49	34 / 86.58	36 / 91.67	38 / 96.77	40 / 101.86	42 / 106.95	44 / 112.05	46 / 117.14	48 / 122.23	50 / 127.32	60 / 152.79	72 / 183.35	84 / 213.90

6000	46.25																

*Because the durability in terms of hours decreases in the [ ] marked range, this range should be avoided whenever possible.
*Because the circumferential speed of pulley within the [ ] marked range is higher than 20m/sec, this range should be avoided whenever possible.
*Values in the table above is for nominal belt width 600(60mm). For other belt widths, these values should be multiplied by the width correction coefficient, Kb, shown in Table 28.

Selection is easy with Timing Pulleys and Belts automatic calculation tool available at: http://fawos.misumi.jp/FA_WEB/pulley_us/

*Because the durability in terms of hours decreases in the [ ] marked range, this range should be avoided whenever possible.
For other belt widths, values above should be multiplied by the width correction coefficient shown in Table 28.

* [ ] The circumferential speed of pulley is 33 (m/s)or more; a dynamic balance for the pulley is essential.

*Avoiding the [ ] marked ranges is recommended as endurance time is shorten

*Balance the traveling speed as wind velocity of pulley in the [ ] marked range reaches more than 33 (m/s)

*The above table shows values for the nominal width 10 (10mm). Multiply a value in the table by correction coefficient Kb in the table 28 for other widths.

*Because the durability in terms of hours decreases in the [ ] marked range, this range should be avoided whenever possible.
For other belt widths, values above should be multiplied by the width correction coefficient shown in Table 28.

Selection is easy with Timing Pulleys and Belts automatic calculation tool available at: http://fawos.misumi.jp/FA_WEB/pulley_us/

*Because the durability in terms of hours decreases in the [ ] marked range, this range should be avoided whenever possible.
For other belt widths, values above should be multiplied by the width correction coefficient shown in Table 28.

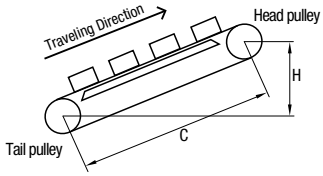
Technical Data

Selection of Conveyor Timing Belts

■ Conveyer belts selection procedure

The following steps for selection is based on the case that sizes of head pulley and tail pulley are same. (Follow the steps 1–3 even when sizes of head pulley and tail pulley are different.)
Use a head pulley as a driving pulley. For belt installation and tension control, make the structure of the driven side to be adjustable of alignment and center distance with set screws.
*Head Pulley: The front of the pulley against traveling direction
Tail Pulley: The rear end of the pulley against traveling direction

[Step 1] Calculate effective tension (Te)



$Te = 9.8(\mu \cdot G + G \cdot H/C)$

Te	(N)	Effective tension
G	(Kg)	Net weight of load placed on the belt surface
μ		Friction coefficient of belt vs. table (Table 1)
H	(mm)	Lift
C	(mm)	Tentative center dimension (conveyor length)

Table 1. Typical Friction Coefficient of Belt versus Table

Table Material	Steel	Stainless	Aluminium	UHMW	Teflon
Friction coefficient: μ	0.65	0.68	0.42	0.31	0.21

[Step 2] Calculate design tension (Td).

$Td = K \cdot Te$

Td	(N)	Design Tension
K		Overload Coefficient
Te	(N)	Effective Tension

$K = K1 + K2 + K3$

K1	Correction factors for daily operation hours
K2	Belt length correction coefficient
K3	Belt speed correction coefficient

Table 2. K1 Correction Factors for Daily Operation Hours Unit: hour

~5	5~8	8~12	12~16	16~24
1.0	1.1	1.2	1.3	1.4

Table 3. K2 Belt Length Correction Factors Unit: mm

~1500	1501~3000	3001~4500	4501~
0.3	0.2	0.1	0.0

Table 4. K3 Belt Speed Correction Factors Unit: m/minute

~60	61~90	91~120
0.0	0.1	0.2

[Step 3] Select belt type, belt width and pulley dimension

(1) Select from Table 5 a belt type and a width which have a greater allowable tension than the designed tension.

Table 5. Allowable Tension of Joint Belts Unit: N

Belt Type	Belt width (mm)						
	10	15	20	25	30	40	50
S5M	120	180	—	300	—	—	—
S8M	—	235	—	392	471	627	—
T5	58	87	116	145	—	—	—
T10	—	180	240	300	360	481	601
AT5	74	110	—	—	—	—	—
AT10	—	234	312	391	—	—	—

Unit: N

Belt Type	Belt Nominal Width				
	050	075	100	150	200
L	92	138	184	276	–
H	—	163	216	324	432

(2) Select a pulley with a larger number of teeth than the minimum allowable number in Table 6 for both of driving and driven pulley.

Table 6. Number of Minimum Allowable Number of Teeth for Pulleys

Belt Type	L	H	S5M	S8M	T5	T10	AT5	AT10
Pitch (mm)	9.525	12.7	5	8	5	10	5	10
Min. No. of Pully Teeth	14	14	14	24	12	14	20	14
Pully Diameter (mm)	42.45	56.60	22.28	61.12	19.10	44.56	31.83	44.56

[Step 4] Determine belt length (no. of teeth) and center distance.

(1) Obtain approximate belt length from tentative center dimension (C') and approximate pulley diameter (Dp').

$Lp' = 2 \cdot C' + \pi \cdot Dp'$

Lp'	(mm)	Approx. belt length
C'	(mm)	Tentative center dimension
Dp'	(mm)	Approx. pully diameter

(2) Determine the number of teeth required from the approximate belt length (Lp') and pitch (P). Round down the obtained number of teeth (N) to the nearest whole number.

$N = Lp' / P$

N		No. of belt teeth
p	(mm)	Pitch

*Check the minimum teeth of belt which is available.

(3) Obtain the proper belt length from the number of teeth (N) and pitch (P).

$Lp = P \cdot N$

Lp	(mm)	Belt length

(4) Determine proper center distance with the following formula:

$C = P \cdot (N - Dz)/2$

C	(mm)	Center Distance
Dz		No. of teeth of pulley

[Step 5] Confirm the ajustment margin for the center distance is larger than figures in Table7-a and 7-b.

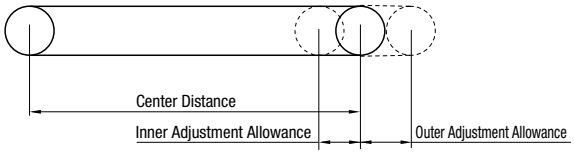


Table 7-a: Inner Adjustment Allowance (Attachment Allowance)

Belt Type	Inner Adjustment Allowance
L	More than 10mm
H	More than 15mm
S5M	More than 10mm
S8M	More than 15mm
T5	More than 5mm
T10	More than 10mm
AT5	More than 10mm
AT10	More than 15mm

Table 7-b: Outer Adjustment Allowance (Tension Allowance)

Distance between shafts (mm)	Outer Adjustment Allowance
0000~0500	More than 5mm
0501~1000	More than 10mm
1001~1500	More than 15mm
1501~2000	More than 20mm
2001~2500	More than 25mm
2501~0000	More than 1% of center distance

[Step 6] Install timing belt

Install the belt with the installation tension in Table 8.
Axis weight at this time is twice the installation tension.

$Fs = 2 \cdot Ti$

Fs	(N)	Shaft load
Ti	(N)	Fixing Tension (Table 8)

Table 8. Installation Tension for Joint Belts Unit: N

Belt Type	Belt width (mm)						
	10	15	20	25	30	40	50

	Polyurethane				397	529	799	1093

– When using belts for other purpose than conveyance (e.g. transmission), for polyurethane belt S3M; design with 1/2 of the allowable tension in the table; for XL, L, H, S5M, S8M, T5 and T10, design with approx. 2/3 of the allowable tension in the table.

Technical Data

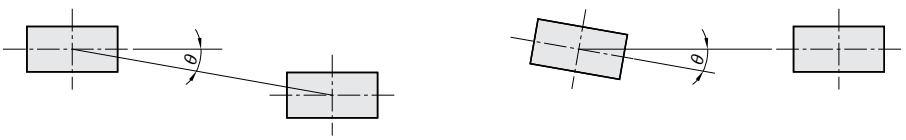
Synchronous Belt Reference Information

■ Early failures and countermeasures

Abnormal Phenomena	Cause	Measures
Abnormal Wear of Belt Side Faces	· Pulley misalignment · Pulley shafts misalignments · Bent pulley flanges	· Realign · Correct shaft misalignments · Correct bent pulley flanges
Tooth Contact Pressure Surface Abnormal Wear	· Overload · Belt tension too high, too low	· Redesign with a wide belt or use larger belt pitch · Adjust initial belt tension
Belt Abnormal Wear of Pulley Contacting Area	· Pulley tooth shape incorrect · Belt tension too high	· Adjust initial belt tension · Remake pulley taking note of tooth tip radius
Broken/Missing Tooth	· Pulley diameter too small · Small pulley meshing 6 teeth or less · Shock loading exists	· Redesign · Increase small pulley tooth mesh or redesign · Avoid shock loading on belt · Increase belt width
Severed Core Wire	· Overload · Core wire decreased elasticity or corrosion · Induction of foreign particels · Excessive temperature	· Redesign · Check belt storage and shipping history/condision · Avoid shocks · Provide a belt cover · Lower environment temperature
Cracks on Backing Rubber	· Usage in low temperature · Pulley diameter too small	· Raise environment temp. · Increase pulley diameter
Heat Degradation of Rubber	· Rubber degradation due to high enviroment temperature	· Lower environment temperature
Rubber Swelling	· Contact with oils · Contact with water	· Avoid oil from contacting · Avoid water from contacting
Abnormal Wear of Pulley Teeth	· Overload · Belt tension too high · Pulley material too soft	· Redesign · Adjust initial belt tension · Apply surface hardening treatment on pulley or change pulley material
Pulley Circumference Wear	· Pulley service life has been reached · Belt tension too high (core wire visible on belt back side)	· Replace with a new pulley · Replace with new pulley and belt, and use lower belt tension
Abnormal Sound	· Belt tension too high · Overload · Pulley diameter too small · Pulley tooth shape incorrect	· Realign · Adjust initial belt tension · Redesign · Correct pulley tooth geometry
Apparent Belt Stretch	· Shaft center distance too small · Loose machine base	· Adjust to correct shaft distance · Reinforce machine base

■ About Pulley Alignments

Misaligned pulleys may cause early belt failure and flange damages.
Align as show below



•MXL/XL/L/H/S_M/MTS_M/T Series

Belt Width (mm)	10	20	30≦
tanθ	5/1000	3/1000	2/1000

•P_M/UP_M

Belt Width (mm)	≦30
tanθ	5/1000

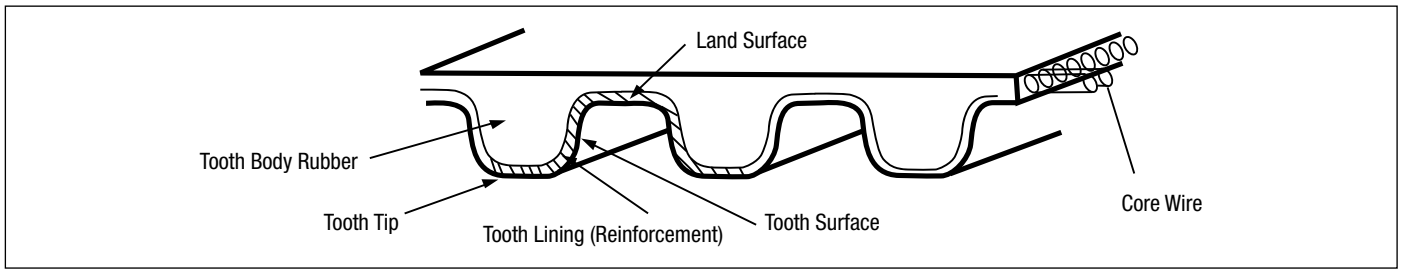
•_GT/EV5GT/EV8YU

Belt Width (mm)	≦20	20＜40
tanθ	6/1000	3/1000

Technical Data

Synchronous Belt Replacement Indicators

■ Belt Structure



■ Examples of Belt Replacement Indicators

Examples	Condition
1. When belt tooth reinforcement fabric is worn and rubber/core wire are exposed. When tooth surface/grooves are worn and rubber/core wire are exposed	2. When the backing rubber shows cracks due to hardening	3. When cracks reaching the rubber are seen at tooth base	
4. Belt side faces are damaged due to wear	
5. When missing tooth can be seen	6. When excessive wear can be seen on belt back side	
7. When belt or core wire are broken	

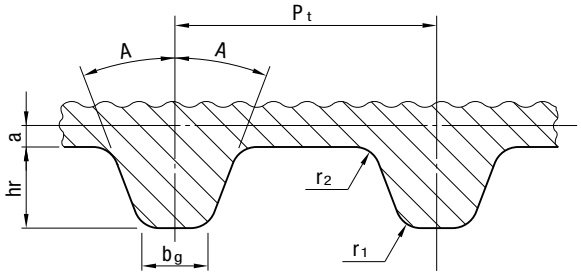
• These are timing belt replacement guides. Early or periodical replacements are recommended even the signs shown above are not yet visible.

Technical Data

Excerpts from JIS B 1856(1993)

Pulley/Tooth Tolerance

1. Dimensions of the Rack for the Cutter and the Tolerances



The pulley should have involute teeth, which are created and shaped by the cutter. The dimensions of the rack for the cutter and the tolerances as determined by analyzing the shape of the rack with a projector, shape measuring instrument or the like, should be agree with the relevant figures in the table below.

Unit: mm

Type	Number of Teeth of the Pulley Z	Pt	A ±0.12	hr +0.05 0	bg +0.05 0	r1 ±0.03	r2 ±0.03	2a(1) (Reference)
MXL	10 ≤ Z ≤ 23 24 ≤ Z	2.032 ± 0.008	28° 20°	0.64	0.61 0.67	0.30	0.23	0.508
XL	10 ≤ Z	5.080 ± 0.010	25°	1.40	1.27	0.61	0.61	0.508
L	10 ≤ Z	9.525 ± 0.012	20°	2.13	3.10	0.86	0.53	0.762
H	14 ≤ Z ≤ 19 20 ≤ Z	12.700 ± 0.016	20°	2.59	4.24	1.47	1.04 1.42	1.372

Note (1): a is a measurement indicating the position corresponding to the pitch line (Centerline of the Core Line of the Belt) of the belt corresponding to the shape of the rack for the cutter.

2. Tolerance of Adjacent Pitch Error and Cumulative Pitch Error

Unit: mm

Addendum Circle Diameter of Pulley d0	Allowable Value	
	Tolerance of Adjacent Pitch Error	Accumulated Pitch Error
5.96 ≤ do ≤ 25.40	0.03	0.05
25.40 < do ≤ 50.80	0.03	0.08
50.80 < do ≤ 101.60	0.03	0.10
101.60 < do ≤ 177.80	0.05	0.13
177.80 < do ≤ 304.80	0.05	0.15
304.80 < do ≤ 508.00	0.08	0.18
508.00 < do ≤ 762.00	0.08	0.20
762.00 < do ≤ 967.16	0.08	0.23

3. Tolerance of Side Deflection

Unit: mm

Addendum Circle Diameter of Pulley d0	Tolerance of Deflection (TIR)(2)
5.96 ≤ do ≤ 101.60	0.10
101.60 < do ≤ 254.00	Addendum Circle Dia. do×0.001
254.00 < do ≤ 967.16	0.25+[(Addendum Circle Dia. d0-254.00)×0.0005]

Note (2): TIR is an abbreviation for Total Indicator Reading and refers to the difference between the max. deflection reading and the min. deflection reading.

4. Tolerances of Addendum Circle Diameter

Unit: mm

Addendum Circle Diameter of Pulley d0	Tolerance
5.96 ≤ do ≤ 25.40	+0.05 0
25.40 < do ≤ 50.80	+0.08 0
50.80 < do ≤ 101.60	+0.10 0
101.60 < do ≤ 177.80	+0.13 0
177.80 < do ≤ 304.80	+0.15 0
304.80 < do ≤ 508.00	+0.18 0
508.00 < do ≤ 762.00	+0.20 0
762.00 < do ≤ 967.16	+0.23 0

5. Tolerance of Circumferential Deflection of Addendum Circle

Unit: mm

Addendum Circle Diameter of Pulley d0	Tolerance of Circumferential Deflection
5.96 ≤ do ≤ 203.20	0.13
203.20 < do ≤ 967.16	0.13 + [(Addendum Circle Dia. d0-203.20) × 0.0005]

6. Tolerance of Cylindricity and Parallelism

Unit: mm

Nominal Widths of Pulley	Cylindricity Tolerance	Parallelism Tolerance
025~050	0.01	0.03
075~150	0.02	
200 · 300	0.04	0.04
400 · 500	0.06	0.05

Technical Data

Excerpts from JIS B 0405, 0419(1991)

Regular Machining Dimension Tolerance

1. Regular Cut Dimension Tolerance B 0405-1991-

Tolerances in Respect of Length Excluding Chamfered Portion

Typically, unless otherwise specified, Misumi uses "medium" tolerance for all machined features. Please, verify the tolerance with Misumi technical team at engineering@misumiusa.com

Unit: mm

Tolerance Class		Classification of Reference Dimension							
Symbol	Description	0.5 (1) or More 3 or Less	More than 3 6 or Less	More than 6 30 or Less	More than 30 120 or Less	More than 120 400 or Less	More than 400 1000 or Less	More than 1000 2000 or Less	More than 2000 4000 or Less
		Tolerance							
f	Precision Grade	±0.05	±0.05	±0.1	±0.15	±0.2	±0.3	±0.5	—
m	Medium	±0.1	±0.1	±0.2	±0.3	±0.5	±0.8	±1.2	±2
c	Coarse	±0.2	±0.3	±0.5	±0.8	±1.2	±2	±3	±4
v	Extremely Coarse	—	±0.5	±1	±1.5	±2.5	±4	±6	±8

Note (1): A reference dimension less than 0.5 mm is followed by a tolerance.

2. Tolerances in Respect of the Length of the Chamfered Portion (Radius of rounding for edges and edge chamfering dimension)

Unit: mm

Tolerance Class		Classification of Reference Dimension		
Symbol	Description	0.5 (2) or More 3 or Less	More than 3 6 or Less	More than 6
		Tolerance		
f	Precision Grade	±0.2	±0.5	±1
m	Medium			
c	Coarse	±0.4	±1	±2
v	Extremely Coarse			

Note (2): A reference dimension less than 0.5 mm is followed by a tolerance.

3. Angle Tolerance

Tolerance Class		Length of Shorter Side (Unit: mm)				
Symbol	Description	10 or Less	More than 10 50 or Less	More than 50 120 or Less	More than 120 400 or Less	More than 400
		Tolerance				
f	Precision Grade	±1°	±30'	±20'	±10'	±5'
m	Medium					
c	Coarse	±1° 30'	±1°	±30'	±15'	±10'
v	Extremely Coarse	±3°	±2°	±1°	±30'	±20'

4. Regular Perpendicularity Tolerance B 0419-1991-

Unit: mm

Tolerance Class	Nominal Length of Shorter Side			
	100 or Less	More than 100 300 or Less	More than 300 1000 or Less	More than 1000 3000 or Less
	Perpendicularity Tolerance			
H	0.2	0.3	0.4	0.5
K	0.4	0.6	0.8	1
L	0.6	1	1.5	2

5. Regular Straightness and Flatness Tolerance

Unit: mm

Tolerance Class	Nominal Length					
	10 or Less	More than 10 30 or Less	More than 30 100 or Less	More than 100 300 or Less	More than 300 1000 or Less	More than 1000 3000 or Less
	Regular Straightness and Flatness Tolerance					
H	0.02	0.05	0.1	0.2	0.3	0.4
K	0.05	0.1	0.2	0.4	0.6	0.8
L	0.1	0.2	0.4	0.8	1.2	1.6

6.Regular Symmetry Tolerance

Unit: mm

Tolerance Class	Nominal Length			
	100 or Less	More than 100 300 or Less	More than 300 1000 or Less	More than 1000
	Symmetry Tolerance			
H	0.5			
K	0.6		0.8	1
L	0.6	1	1.5	2

Technical Data

Basis of Fitting Selection/Dimensional Tolerances and Fitting

		H6	H7	H8	H9	Applicable Part	Functional Classification		Application Example
Can be Moved Relatively	Clearance Fit – Loose Fit				c9	Part which accommodates a wide gap or moving part which needs a gap. Part which accommodates a wide gap to facilitate assembling. Part which needs an appropriate gap even at a high temperature.	Part whose structure needs a gap. Inflates. Large position error Fitting length is long. Cost needs to be reduced. Manufacturing Cost Maintenance Cost		Piston Ring and the Ring Groove Fitting by means of a loose set pin.
	Clearance Fit – Light Roll Fit			d9	d9	Part which accommodates or needs a gap.			Crank Web and Pin Bearing (Side) Exhaust Valve Box and the Sliding Part of a Spring Bearing Piston Ring and the Ring Groove
	Clearance Fit – Light Roll Fit		e7	e8	e9	Part which accommodates a wide gap or needs a gap. Fairly wide gap, well greased bearing. Bearing subjected to a high temperature, high speed and heavy load (high-degree forced lubrication).	Regular Rotary or Sliding Part (Must be well greased.)		Fitting of the Exhaust Valve Box Main Bearing for the Crank Shaft Regular Sliding Part
	Clearance Fit – Roll Fit	f6	f7	f7 f8		Fitting so as to provide an appropriate gap to permit movement (high-quality fitting). Regular normal temperature bearing lubricated with grease or oil.	Regular Fitting (Often comes apart.)		Part in which a cooled exhaust valve box is inserted. Regular Shaft and Bushing Link Device Lever and Bushing
	Clearance Fit – Fine Roll Fit	g5	g6			Continuously revolving part of a precision machine under a light load. Fitting with a narrow gap so as to permit movement (spigot and positioning). Precision sliding part.	Part required to make a precision motion with virtually no play.		Link Device Pin and Lever Key and its Groove Precision Control Valve Rod
Cannot be Moved Relatively	Transition Fit – Sliding Fit	h5	h6	h7 h8	h9	Fitting so as to permit movement by hand, with a lubricant applied. (high-quality positioning) Special High Precision Sliding Part Unimportant Stationary Part	Can be disassembled, reassembled without damaging component parts.	Force cannot be transmitted by the fitting force alone.	Fitting a rim and a boss together Fitting the gear of a precision gear device
	Transition Fit – Push Fit	h5 h6	js6			Fitting which accommodates a light gap. Precision fitting which locks both parts while the unit is used. Fitting which allows assembling and disassembling with a wooden or lead hammer.			Fitting Coupling Flanges Together Governor Path and Pin Fitting a Gear Rim and a Boss Together
	Transition Fit – Driving Fit	js5	k6			Fitting which requires an iron hammer or hand press for assembling, disassembling (a key or the like is necessary to prevent inter-part shaft rotation). Precision positioning.			Fixing the Shaft of a Gear Pump and a Casing Together Reamer Bolts
	Transition Fit – Driving Fit	k5	m6			Same as the above for assembling and disassembling. Precision positioning which allows no gap.			Reamer Bolts Fixing the piston of hydraulic equipment and a shaft together Fitting a Coupling Flange and a Shaft Together
	Transition Fit – Light Press Fit	m5	n6			Fitting which requires considerable force for assembling, disassembling. Precision stationary fitting (a key or the like is necessary for high torque transmission purposes)		Slight force can be transmitted by the fitting force alone.	Shaft of a Flexible Coupling and Gear (Passive Side) Precision Fitting Insertion of a Suction Valve and Valve Guide
	Interference Fit – Press Fit	n5 n6	p6			Fitting which requires much force for assembling, disassembling (a key or the like is necessary for high torque transmission). Light press fitting or the like is necessary for non-ferrous component parts. Standard press fitting is required for iron component parts and a bronze part and a copper part.	Hard to disassemble without damaging component parts.		Insertion of a Suction Valve and Valve Guide Fixing a Gear and a Shaft Together (Low Torque) Shaft of a Flexible Coupling and a Gear (Drive Side)
	Interference Fit – Press Fit	p5	r6			Same as the above for assembling and disassembling. Shrinkage press fitting, cold press fitting or forced press fitting is required for large component parts.			Coupling and Shaft
	Interference Fit – Strong Press Fit, Shrinkage Fit, Freeze Fit	r5	s6 t6 u6 x6			Firmly coupled together and requires shrinkage press fitting, cold press fitting or forced press fitting. Permanent assembly, which can not come apart. Press fitting or the like is required for light alloy members.		Considerable force can be transmitted by the fitting force alone.	Attaching and Fixing a Bearing Bushing Insertion of a Suction Valve and Valve Box Fixing a Coupling Flange and a Shaft Together (High Torque) Fixing the Rim of a Drive Gear and a Boss Together Attaching and Fixing a Bearing Bushing

Reference: In each column, the upper value is the upper dimensional tolerance, and the lower figure is the lower one. [Note]*:n5 is the previous version of JIS. Presented here because many MISUMI products conform to this version.

Technical Data

Surface Roughness

JIS B 0601(1994)
Excerpts from JIS B 0031(1994)

1. Varieties of Surface Roughness Indicators

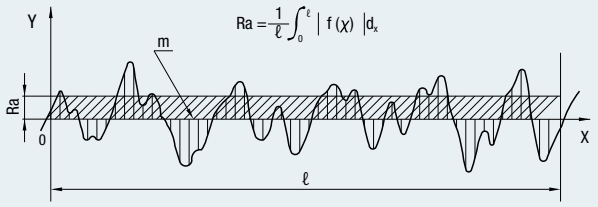
Definitions and presentations of arithmetic average roughness(Ra), maximum height(Ry), 10 spot average roughness(Rz), average concave to convex distance(Sm), average distance between local peaks S and load length rate tp are given as parameters indicating the surface roughness of an industrial product. Surface roughness is the arithmetical average of values at randomly extracted spots on the surface of an object.

[Centerline average roughness(Ra75)is defined in the supplements to JIS B 0031 and JIS B 0601.]

Typical calculations of surface roughness

Arithmetic Average Roughness Ra

A portion stretching over a reference length in the direction in which the average line extends is cut out from the roughness curve. This portion is presented in a new graph with the X axis extending in the same direction as the average line and the Y axis representing the magnitude. Ra is represented by the equation shown at right, in microns(μm).

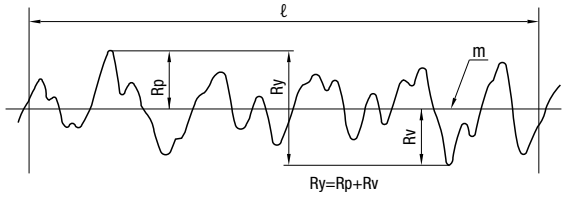


$$Ra = \frac{1}{\ell}\int_0^{\ell} |f(x)|\,dx$$

Maximum Height Ry

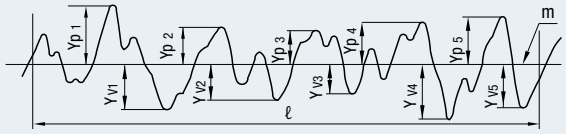
A portion stretching over a reference length in the direction in which the average line extends is cut out from the roughness curve. The gap between the peak line and the trough line is measured in the direction in which the magnitude axis extends, in microns(μm).

Reference A portion without an abnormally high peak or abnormally low trough, which may be regarded as a flaw, is cut out over the reference length.



Ten-spot Average Roughness Rz

A portion stretching over a reference length in the direction in which the average line extends is cut out from the roughness curve. The average of the levels(Yp)of the highest peak to the fifth highest peak as measured from the average line and the average of the levels(Yp)of the lowest trough to the fifth lowest trough similarly measured in the said portion are added together. Rz is this sum, in microns(μm).



$$Rz = \frac{|Yp_1 + Yp_2 + Yp_3 + Yp_4 + Yp_5| + |Yv_1 + Yv_2 + Yv_3 + Yv_4 + Yv_5|}{5}$$

$Yp_1, Yp_2, Yp_3, Yp_4, Yp_5$: Levels of the highest peak to the fifth highest peak in the said portion with the reference length ℓ.

$Yv_1, Yv_2, Yv_3, Yv_4, Yv_5$: Levels of the lowest trough to the fifth lowest trough in the said portion with the reference length ℓ.

Reference Relation between Arithmetic Average Roughness (Ra) and Conventional Parameters

Arithmetic Average Roughness Ra			Maximum Height Ry	Ten-spot Average Roughness Rz	Reference Length of Ry (Rz) ℓ (mm)	Conventional Finish Symbol
Standard Series	Cut-off Value c (mm)	Graphical Representation of Surface Texture	Standard Series

50 a 100 a	—	50 ~ 100	200 s 400 s	200 z 400 z	8 —	~

*Interrelations among the three types shown here are not precise, and are presented for convenience only.
*Ra:The evaluation values of Ry and Rz are the cut-off value and the reference length each multiplied by five, respectively.

Technical Data

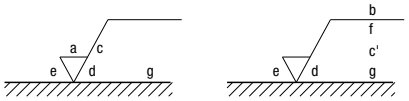
Excerpts from JISB0031(1994)

Drawing Indications of Surface Texture

1. Positions of Auxiliary Symbols for Surface Symbol

A surface roughness value, cut-off value or reference length, machining method, grain direction, surface undulation, etc. are indicated around the surface symbol as shown in Fig. 1 below.

Fig. 1 Positions of Auxiliary Symbols



a : Ra Value
b : Machining Method
c : Cut-Off Value, Evaluation Length
c' : Reference Length, Evaluation Length
d : Grain Direction
f : Parameter other than Ra(tp:Parameter/Cut-Off Level)
g : Surface Undulation(JIS B 0610)

Reference These symbols except a and f are provided when they are needed.

Reference Under ISO 1302, a finish range should be indicated as e in Fig. 1.

Code	Meaning	Illustration
=	The trace left by a cutting instrument is parallel to the projection plane in the drawing. Ex. Shaped Surface	Trace Left by a Cutting Instrument
⊥	The trace left by a cutting instrument is perpendicular to the projection plane in the drawing. Ex. Shaped Surface(Side View) Circular Cut, Cylindrical Cut	Trace Left by a Cutting Instrument
X	The pattern left by a cutting instrument diagonally crosses the projection plane in the drawing. Ex. Honed Surface	Trace Left by a Cutting Instrument
M	The pattern left by a cutting instrument crosses in various directions or has no grain direction. Ex. Lapped Surface, Superfinished Surface and Surface Finished with a Front Mill or End Mill	
C	The pattern left by a cutting instrument is virtually concentric around the center of the plane in the drawing. Ex. Faced Surface	
R	The pattern left by a cutting instrument is virtually radial around the center of the plane in the drawing.

Note(1): The nominal of a tapered male thread is given here. For a taper female thread or parallel female thread, R should be replaced with Rc or Rp. (Refer to*)

(2): Tapered thread: length from position of gauge dia. spot to a minor dia. spot. /Parallel female thread: length from a pipe end or pipe fitting end.

Reference
1. The threads should be at right angles to the central axial line, and the pitch should be measured along the central axial line.
2. The length of the effective thread means the length over which threads are fully provided. A pipe or a pipe fitting may be left in place on the crests of the last few threads. A chamfered end, if any, of a pipe or a pipe fitting should be included in the length of the effective thread.
3. When the value of a, f and t does not meet the requirements, the criteria of other standard is provided.

(*) Tapered threads type for a pipe are specified as taper male thread for a pipe, taper female thread and parallel female thread for a pipe.
The parallel female thread for a pipe should be mated with a tapered male thread for a pipe, and differs in dimension tolerances from the parallel female thread specified by JIS B 0202.

Note [1]: Column 1 for s (max.) is applicable to strength class 8.8, 10.9, A 2-50 and A 2-70; Column 2 should be applied to strength class 12.9.
Column 1 may be applicable to strength class 12.9 in accordance with an agreement made between the delivering and receiving sides.
When the nominal of thread is M20 or larger, s (max.) should be applied to all strength classes.

Note [2]: Nominal of thread in brackets should not be used unless it is absolutely necessary.

Reference

1. A side of the head should be knurled into a straight line or crisscross pattern [refer to JIS B 0951 (knurling pattern)]. dk(max.) should be the value marked with**.
If no knurled pattern is needed, purchasers can indicate that. However, dk(max.) should be the value marked with*.

2. Recommended nominal lengths (L) for individual nominal of thread are shown within the bold lines.
If L is shorter than the dotted line, the thread should be fully threaded, and the incompletely threaded part length beneath the neck should be approximately 3P.

3. lg (max.) and lg (min.) for a screw, whose length (L) exceeds the dotted line, are obtained by the equations below:

lg(Max)=Nominal Length(L)-b

ls(Min)=lg(Max)-5P

2. L, s and g of Hexagon Socket Head Cap Screws

Technical Data

Proper Bolt Axial Tightening Force and Proper Tightening Torque

■ Axial Tightening Force for Bolt and Fatigue Limit

- The proper axial tightening force for a bolt should be calculated within an elasticity range up to 70% of the rated yield strength when the torque method is used.
- The fatigue strength of bolt under repeated load should not exceed the specified tolerance.
- Do not let the seat of a bolt or nut dent the contact area.
- Do not break the tightened piece by tightening.

A bolt is tightened by torque, torque inclination, rotating angle, stretch measurement and other methods. The torque method is widely used due to its simplicity and convenience.

■ Calculation of Axial Tightening Force and Tightening Torque

The relation between the axial tightening force and Ff is represented by Equation (1) below:

$Ff=0.7\times\sigma y\times As$……(1)

Tightening torque T_{fA} can be obtained by using the following formula(2).

$T_{fA}=0.35k(1+1/Q)\sigma y \cdot As \cdot d$……(2)

k : Torque Coefficient
d : Nominal Diameter of Bolt [cm]
Q : Tightening Coefficient
σy : Tensile strength (When the strength class is 12.9, it is 112kgf/mm^2)
As : Effective Sectional Area of the Bolt [mm^2]

■ Calculation Example

Proper torque and axial force for Mild steel pieces tightened together by means of a hexagon socket head cap screw, M6 (strength class 12.9), with the pieces lubricated with oil can be calculated.

- Proper Torque, by using Equation (2)

$T_{fA}=0.35k\ (1+1/Q)\ \sigma y \cdot As \cdot d$
$=0.35 \cdot 0.17\ (1+1/1.4)\ 1098 \cdot 20.1 \cdot 0.6$
$=1351$[N · cm] {138[kgf · cm]}

- Axial Force Ff, by using Equation(1)

$Ff=0.7\times\sigma y\times As$
$=0.7\times1098\times20.1$
$=15449$[N] {1576[kgf]}

■ Surface Treatment for Bolt and Torque Coefficient Dependent on the Combination of Material for Area to be Fastened and Material of Female Thread

SUS: Stainless Steel

■ Standard Value of Tightening Coefficient Q

Tightening Coefficient Q	Tightening Method	Surface Condition		Lubrication
		Bolts	Nuts	
1.25	Torque Wrench	Manganese Phosphate	Not treated or Treated with Phosphate.	Lubricated with oil or MoS^2 paste
1.4	Torque Wrench Limited-Torque Wrench	Not treated or Treated with Phosphate.		
1.6	Impact Wrench			
1.8	Torque Wrench Limited-Torque Wrench	Not treated or Treated with Phosphate.	No Treatment	Unlubricated

Strength Class
Ex. 12.9
Tensile Strength (Yield Stress): 90% of the minimum value of tensile strength
The minimum value of tensile strength is 1220N/mm^2 { 124kgf/mm^2 }
10.9
Tensile Strength (Yield Stress): 90% of the minimum value of tensile strength
The minimum value of tensile strength is 1040N/mm^2 { 106kgf/mm^2 }

(Note) • Tightening Conditions:Use of a torque wrench(Lubricated with Oil, Torque Coefficient k=0.17, Tightening Coefficient Q=1.4) • The torque coefficient varies with the conditions of use. Values in this table should be used as rough referential values. • The table is an excerpt from a catalog of Kyokuto Seisakusho Co., Ltd.

Technical Data

Strength of Bolts, Screw Plugs and Dowel Pins

■ Strength of Bolt

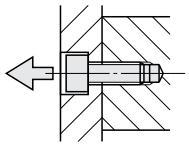
1) Tensile Load Bolt

P=σt×As.....(1)
=πd2σt/4.....(2)

Pt : Tensile Load in the Axial Direction [N]
σb : Yield Stress of the Bolt [N/mm^2]
σt : Allowable Stress of the Bolt [N/mm^2]
(σt=σb/Safety Factorα)
As : Effective Sectional Area of the Bolt [mm^2]
As=πd2/4
d : Effective Dia. of the Bolt (Core Dia.) [mm]

(Ex.) The proper size of a hexagon socket head cap screws, which is to bear a repeated tensile load (pulsating) at P=1960N {200 kgf} , should be determined. (The hexagon socket head cap screws are 4137 Alloy Steel, 38 to 43 HRC, strength class 12.9)

(1) Using Equation
As=Pt/σt
=1960/219.6
=8.9 [mm^2]



∴ By finding a value greater than the result of the equation in the Effective Sectional Area column in the table on the right, M5, 14.2[mm^2], should be selected.
M6, allowable load of 2087N {213 kgf}, should be selected from the column for strength class 12.9, with the fatigue strength taken into account.

2) If the bolt, like a stripper bolt, is to bear a tensile impact load, the right size should be selected from the fatigue strength column.(Under a load of 1960N {200kgf}, stripper bolt made of 4137 Alloy Steel, 33 to 38 HRC, strength class 10.9)

By finding a value greater than the allowable load of 1960N {200 kgf} in the Strength Class 10.9 column in the table on right, M8, 3116[N] {318[kgf]}, should be selected. Hence, MSB10 with the M8 threaded portion and an axial diameter of 10 mm should be selected.
If it is to bear a shearing load, a dowel pin should also be used.

■ Strength of Screw Plug

When screw plug MSW30 is to bear an impact load, allowable load P should be determined. (The materials of MSW30 are 1045 Carbon Steel, 34 to 43 HRC, tensile strength σt 637N/mm^2 {65kgf/mm^2.})

If M S W is shorn at a spot within the root diameter section and is broken, allowable load P can be calculated as shown below.

Allowable Load P=τt×A
=3.9×107.4
=40812[N] {4164[kgf]}

Find the allowable shearing force base on the core diameter of female thread if a tap is made of soft material.

Area A=Root Diameter d1×π×L
(Root Diameter d1≈M–P)
A=(M–P)πL=(30–1.5)π×12
= 1074 [mm^2]

Yield Stress≈0.9×Tensile Strength σb=0.9×637=573[N/mm^2]

Shearing Stress≈0.8×Yield Stress
= 459 [N/mm^2]

Allowable Shearing Stress
τt=Shearing Stress/Safety Factor12
= 459/12=38 [N/mm2] {3.9 [kgf/mm^2]}

■ Strength of Dowel Pins

The proper size of a dowel pin under repeated shearing load of 7840N {800 kgf} (Pulsating) should be determined.
(The material of Dowel Pins is 52100 Bearing Steel.
Hardness 58HRC~)

P=A×τ
=πD2τ/4
D=$\sqrt{(4P)/(\pi\tau)}$
=$\sqrt{(4\times7840)/(3.14\times188)}$
≈7.3

Yield Stress for 52100 Bearing Steel
σb=1176 [N/mm^2] {120 [kgf/mm^2]}

Allowable Shearing Strength
τ=σb×0.8/Safety Factor α
=1176×0.8/5
=188 [N/mm2] {19.2 [kgf/mm^2]}

∴ D8 or a larger size should be selected for MS.
If the dowel pins are of a roughly uniform size, the number of the necessary tools and extra pins can be reduced.

■ Safety Factorα of Unwin Based on Tensile Strength

Materials	Static Load	Repeated Load		Impact Load
		Pulsating	Reversed	
Steel	3	5	8	12
Cast Iron	4	6	10	15
Copper, Soft Metal	5	5	9	15

Allowable Stress = Reference Strength / Safety Factor$_\alpha$
Reference Strength:Yield Stress for Ductile Material
Fracture Stress for Fragile Material

The yield stress, strength class 12.9, is σb=1098[N/mm^2] {112[kgf/mm^2]}.
Allowable Stress σ t= σ b/Safety Factor (from the above table Safety Factor 5)
=1098/5
=219.6[N/mm^2] {22.4[kgf/mm^2]}

■ Fatigue Strength of Bolt (Thread: Fatigue Strength is 2 million times)

Nominal of Thread	Effective Sectional Area as mm^2	Strength Class			
		12.9		10.9	
		Fatigue Strength†	Allowable Load	Fatigue Strength†	Allowable Load
		N/mm^2 [kgf/mm^2]	N {kgf}	N/mm^2 [kgf/mm^2]	N {kgf}
M 4	8.78	128 {13.1}	1117 {114}	89 {9.1}	774 {79}

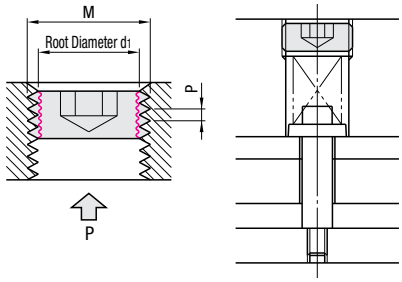
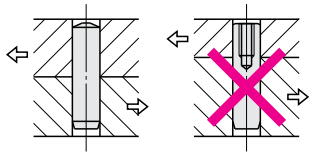
M16	157	57 {5.8}	8928 {911}	56 {5.7}	8771 {895}
M20	245	51 {5.2}	12485 {1274}	50 {5.1}	12250 {1250}
M24	353	46 {4.7}	16258 {1659}	46 {4.7}	16258 {1659}

Fatigue strength* is a revision of an excerpt from "Estimated Fatigue Limits of Small Screws, Bolts and Metric Screws for Nuts" (Yamamoto).





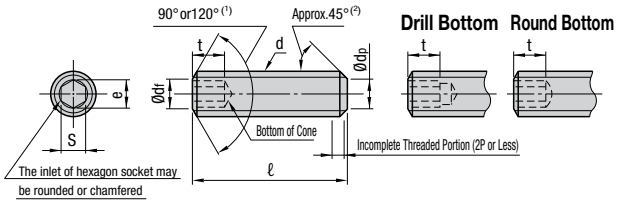
The dowel pin must not be loaded.

Typical strength calculations are presented here. In practice, further conditions including hole-to-hole pitch precision, hole perpendicularity, surface roughness, circularity, plate material, parallelism, quenching or non-quenching, precision of the press, product output, wear of tools should be considered. Hence the values in these examples are typical but not guaranteed values.

Technical Data

Hexagon Socket Set Screws (Flat Type)

1. Shape and Dimension of Hexagon Socket Set Screws and Its Flat End (JIS B 1177-1997).



Note (1): Should be chamfered to 120° if l falls short of the dotted line, which forms stairs, in the table.
(2): 45° Slanted portion below the trough diameter line of the male thread.

Note (3): when e min.=1.14×s(min.) Excluding nominal of thread M25 or less for screws.
(4): The values in Column 1 for t min. are applicable to the nominal lengths (l) falling short of the dotted border, and the values in Column 2 to the nominal lengths beyond the border.
(5): Min.rand max. are based on JIS B 1021. They are rounded to the first digit below zero.

Reference
1. Recommended nominal lengths (l) for individual nominal of thread are enclosed by thick lines.
If the required l-value is not given in the table, it should be specified by the ordering side.
2. The shape and dimensions of the flat end of the screw are based on JIS B 1003 (shape and dimensions of the end of the screw).
3. The shape of the hexagon socket bottom may be a conical, drill or round bottom.

The shape and dimensions indicated in the reference table are based on ISO 4026-1977.

Reference

1. Priority should be given to the nominal of thread in Column Ⅰ. The screw size codes are based on JIS B 0123.
2. Recommended nominal lengths(L)for individual nominal of thread are enclosed by thick lines.
3. When the thread part length (b) of a bolt exceeds the max. nominal value given within the thick lines, the tolerance of the thread part length should be agreed upon by the delivering and receiving sides, corresponding to JIS B 1021.
4. Max. value lg and Min. value ls as follows: lg max Nominal Length(L)-b, ls min.=lg max-5P(P=Coarse Thread Pitch)
5. da and r in this table are based on JIS B 1005.
6. "Chamfered" and "Unpointed", the shape of the end screw should be decided according to JIS B 1003.
7. The asterisked figures in the table are values after correction with the relevant international standard.

*With some of the hexagon bolts and hexagon nuts for M10 and M12 distributed at present, the opposite side S is based on JIS prior to the revision.

Reference 1. Nominal of thread in brackets should not be used unless it is absolutely necessary.
2. The shape of nuts, unless otherwise designated, shall be "double chamfered", and the "washer faced" shall be as designated by the purchaser.
Chamfering for the "washer faced" threads shall based on the chamfered dimensions for "double chamfered".

*With some of the hexagon bolts and hexagon nuts for M10 and M12 distributed at present, the opposite side S is based on JIS prior to the revision.

Reference 1. The nominal diameter is dependent on the diameter of the pin hole.
2. d is a value for a spot somewhere between the end and the l/2 spot.
3. The end may be pointed or flat. If a pointed end or a flat one is needed, it should be specified.
4. The length (l) should be one enclosed by thick lines. The value in an enclosed area is a tolerance. If the required r-value is not given in the table, it should be specified by the ordering side.
5. The head must not tilt excessively from the axial center.

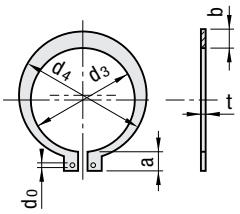
Note(1): d should be measured with a limit plug gauge. Note(2): thickness(t)=1.6mm, may be kept at 1.5mm for the time being. m should be 1.65mm.
Reference: The recommended dimensions of the applicable shaft are given here for reference.

Technical Data

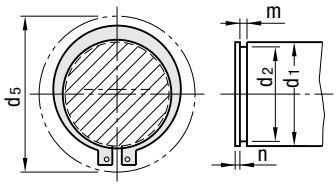
Retaining Rings (C Type)

Excerpts from JIS B 2804(2001)

1. Retaining Rings-C Type-External



The hole with diameter d_0 should be positioned to protrude out of the groove when the retaining ring is inserted in the shaft.



d_5 is the max. outer diameter when the retaining ring is fitted onto the shaft.

Retaining Rings-C Type-External

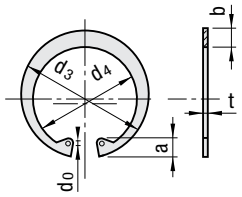
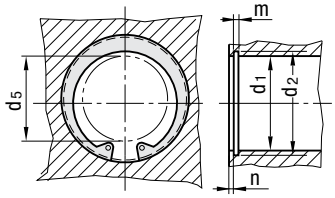
Note[1]: Priority should be given to values not in ( ). A value in ( ) may be used if necessary.
Note[2]: Thickness(t)=1.6mm, may be kept at 1.5mm for the time being. m should be 1.65mm.
Reference: 1. The minimum width of the ring of the retaining ring should be less than the plate thickness t.
2. The recommended dimensions of the applicable shaft are given here for reference.
3. d_4 (mm) should preferably be equal to d4=d3+(1.4~1.5)b.
Reference: The thickness t, conforms to the Japan Spring Manufactures Association Standard, JSMA No. 6-1976 (steel belt for a spring).

2. Retaining Rings-C Type-Internal



The hole with diameter d_0 should be positioned to protrude out of the groove when the retaining ring is inserted in the hole.



d_5 is the minimum diameter of the internal circumference when the retaining ring is fitted.

Unit: mm

72	76.5				6.6	7.4		57	72	75				
75	79.5				6.6	7.8		60	75	78				
(78)	82.5	±0.55			6.6	8		62	78	81	+0.35 0			
80	85.5				7	8		64	80	83.5				

Note[1]: Priority should be given to values not in( ). A value in( )may be used if necessary.
Note[2]: Thickness(t)=1.6mm, may be kept at 1.5mm for the time being. m should be 1.65mm.
Reference: 1. The minimum width of the ring of the retaining ring should be less than the plate thickness t.
2. The recommended dimensions of the applicable shaft are given here for reference.
3. d_4(mm)should preferably be equal to d4=d3−(1.4~1.5)b.
Reference: The thickness t, conforms to the Japan Spring Manufactures Association Standard, JSMA No. 6-1976 (steel belt for a spring).

Note(1) The applicable shaft diameter is calculated from the torque corresponding to the strength of the key, for presentation as referential data for general-purpose use. When the key is of an appropriate size relative to the torque to be transmitted, a shaft thicker than the applicable shaft diameter may be used. In some cases, t_1 and t_2 should be adjusted so that a side of the key will come into uniform contact with the shaft and the hub. A shaft narrower than the applicable shaft diameter should not be used.

Reference The nominal sizes given in ( ) do not conform to the relevant international standard and must not be used in new design.

100×50	100		50			80		–		100			31.0	18.1		440~500

Note(1): From the values for l given below, which are in the appropriate range in the table, one should be selected.
The tolerance for l should be h12 under JIS B0401 (dimension tolerance and fitting), in principle.
6,8,10,12,14,16,18,20,22,25,28,32,36,40,45,50,56,63,70,80,90,100,110,125,140,160,180,200,220,250,280,320,360,400

Note(2): The appropriate shaft diameter should be matched with the torque corresponding to the strength of the key.

Reference: The nominal sizes given in ( ) should not be used unless they are absolutely necessary.
The groove for the boss should be slanted to 1/100, in principle.

Materials

Varieties and Applications 1

1. General Steel Materials

Type	Material Code	Applications	Comment	JIS	Flat Bar	Square Bar	Hexagonal Bar	Round Bar	Steel Plate	Section Steel
Rolled Steel for General Structure	1018 Carbon Steel	General Machine Parts	Fine Workability and Weldability	JIS G 3101	0	0		0	0	0
Polished Steel Bar (Cold-Drawn)	JIS-SS400D	General Machine Parts	Excellent Precision and Surface Roughness. Ready for use directly after slight cutting.	–	0	0	0	0		
Carbon Steel for Machine Structural Use	1045 Carbon Steel	General Machine Parts	Fit for Hardening Tensile Strength 58kgf/mm^2	JIS G 4051	0	0	0	0	0	
	1049 Carbon Steel		Fit for Hardening Tensile Strength 66kgf/mm^2							
Carbon Tool Steel	W1-9 Tool Steel	Shafts, Pins, etc.	For Drill Rod (Round Bar) SK4 surface-finished after cold drawing. Class 7(–DG7)=h7 Class 8(–DG8)=h8 Class 9(–DG9)=h9.	JIS G 4401	0			0		
	W1-8 Tool Steel				0			0	0	
Alloy Tool Steel	JIS-SKS93	Hardening Parts	Deformation caused by Hardening is much less than that of SK material.	JIS G 4404	0	0		0		
	01 Tool Steel									
Chrome Molybdenum Steel	4137 Alloy Steel	General Machine Parts requiring strength Screws, etc.	Tensile Strength 70kgf/mm^2, Tensile Strength after Hardening & tempering: 95 kgf/mm^2 or more. Hardness: HB270 or more. Hardening: HRC50 or more.	JIS G 4105	0	0	0	0	0	
	SCM415 Alloy Steel									
	JIS-SCM420									
Sulfuric and Sulfur Compound Free Cutting Steel	1212 Carbon Steel	General Machine Parts (Free-Cutting steel)	Made of carbon steel plus sulfur to enhance machinability.	JIS G 4804		0	0	0		
	12L13 Carbon Steel		Free-Cutting Steel containing sulfur and lead.							
	12L14 Carbon Steel									
High Carbon Chrome Bearing Steel	52100 Bearing Steel	Roller Bearings, etc.	Bearing Steel	JIS G 4805				0		
Cold-Rolled Steel Plate	Low Carbon Steel	Covers, Cases, etc.	Rolled at an almost ambient temperature. High dimensional precision and fair texture. Fine machinability. Easy to bend, wring and cut. Fine Weldability.	JIS G 3141					0	
Hot-Rolled Steel Plate	Low Carbon Steel	General Machine Structural Parts	Plates for general use are 6 mm or less in thickness.	JIS G 3131					0	

2. Stainless Steel Materials

Type	Material Code	Applications	Comment	Magnetism	JIS	Flat Bar	Square Bar	Hexagonal Bar	Round Bar	Steel Plate	Section Steel
Austenite	303 Stainless Steel	Machine parts requiring antirusting	18-8 Free-Cutting Stainless Steel, Non-Magnetic. More Machinable than SUS304	None*	JIS G 4303~	Good			Good		
Austenite	304 Stainless Steel	Machine parts requiring antirusting	Most Versatile Antirusting and Heat-Resisting Steel for General Use	None*		Good	Good	Good	Good	Good	Good
Austenite	316 Stainless Steel	Machine parts requiring antirusting	More resisting to seawater and other media than SUS304.	None*		Good			Good	Good	
Martensite	440C Stainless Steel	Machine parts requiring antirusting (Less corrosion resistant than austenite.)	Fit for Hardening.	Available					Good		
Martensite	410 Stainless Steel	Machine parts requiring antirusting (Less corrosion resistant than austenite.)	Fit for Hardening. Fine Machinability.	Available					Good		

*Martensite exhibits magnetic properties. Machining of Austenite may cause magnetic properties.

<Reference: Corrosion Resistance of Stainless Steel>

Testing Method

Conforms to the JIS H 8502 Cycle Test Method as a complex corrosion test

Test Conditions

(1) Salt water spray test (5%NaCl. 35˚C) 2 hr
(2) Drying (60˚C) 4 hr
(3) Wetting (95%RH. 35˚C) 2 hr
One cycle takes 8 hr

Appearance of test piece 48 hr, 168 hr before test.

	1018 Carbon Steel	440C Stainless Steel	304 Stainless Steel	316 Stainless Steel	*G–STAR
Before Test					
48 hr					
168 hr					

*G-STAR is martensite stainless steel (pre-hardened steel) manufactured by the Daido Special Steel Co., Ltd.

3. Aluminum Alloy Materials

Type	Material Code	Applications	Comment	JIS	Flat Bar	Square Bar	Hexagonal Bar	Round Bar	Section Steel
Al–Cu Alloy	A2011	General-Use Strength Materials	Free-Cutting Alloy. It excels in machinability but has worse corrosion resistance.	JIS H 4000			Good		
Al–Cu Alloy	A2017	General-Use Strength Materials	High Strength and Machinability Duralumin		Good		Good	Good	
Al–Mg Alloy	A5052	General Machine Parts Covers, cases, etc.	Most typical aluminum alloy with medium strength. With high fatigue strength in comparison with its strength and high corrosion resistance to seawater.		Good			Good	
Al–Mg Alloy	A5056	General Machine Parts	It has fine machined surface and high corrosion resistance to seawater. It has fine machined surface and high corrosion resistance to seawater.				Good		
Al–Mg–Si Alloy	A6061	General Machine Parts	Heat-treated corrosion resisting alloy. High durability owing to T6 treatment.		Good		Good		
Al–Mg–Si Alloy	A6063	General Machine Parts and Structural Material	Weaker than 6061, but more extrudable. Applicable to complex cross-sections shapes. Good corrosion resistance and surface treatment.		Good	Good			Good
Al–Zn–Mg Alloy	A7075	Jigs and Dies	It is one of the strongest aluminum alloys but has worse corrosion resistance. Extra Super Duralumin		Good				

JIS Acronyms for Non-Ferrous Metal

P	Plate, Strip, Disk
PC	Laminate
BE	Extruded Bar
BD	Drawn Bar
W	Drawn Wire

TE	Seamless Extruded Tube
TD	Seamless Drawn Tube
TW	Welded Tube
TWA	Arc-Welded Tube
S	Extruded Section

BR	Riveted Bar
FD	Die-Forged Part
FH	Free-Forged Part

Quality Codes for Aluminum and Aluminum Alloys

Code		Definition	Description
F		Plain Manufactured Material	Completed as a product, without any order for thermal refining. Extruded or forged material, not thermally refined.
H112		Wrought material, for which certain mechanical properties are guaranteed without the need of hardening.	
O		Brought into the softest state by annealing.	Completely re-crystallized by annealing. A thermally treated alloy should be cooled at a temperature below the annealing temperature to prevent the effect of annealing completely.
H	H1n	Hardened by cold working.	n is a numeral from 1 to 9, representing the degree of hardening. "8" represents hard material, and "4" represents the state halfway 1/2 between 0 and hard material. "2" represents the level halfway between 0 and 1/2 hardness, and "6" the state halfway between 1/2 hardness and hard material.
	H2n	Hardened and then properly softened by heat.	
	H3n	Stabilized after cold working.	
T	T1	Cooled after high-temperature working and then allowed to age naturally.	Quenched at the end of a cold working process and allowed to age and harden at ambient temperature. Extruded material is typical material processed in this way. Cold working such as correction may be conducted unless it affects the strength. Used for an alloy such as 6063, for which the effect of quenching can be realized by cooling after hot working (extrusion).
	T3	Allowed to age naturally after solution treatment and cold working.	Cold working is conducted for plates, rods, tubes, etc. to enhance the strength in some cases, and to improve the corrective dimension precision in other cases, with an obvious effect. T361 when cold working is performed to a higher degree than that for T3.
	T351	Allowed to age naturally after solution treatment and cold working.	Cold working is conducted to enhance the strength after solution treatment, and then it is tension processed to give 1.5% to 3% permanent distortion to remove residual tension, and allowed to age naturally.
	T4	Natural aging after solution treatment	Aging is usually completed after exposure to ambient temperature for approx. 4 days. In the case of 7N01, however, aging is a longer process. The tensile property upon the elapse of one month is adopted as referential data. The variety that is given T4 treatment by a user under specified conditions is called T42.
	T5	Hardened through artificial aging after high-temperature processing and quenching	Hardened through artificial aging to improve the mechanical properties and stabilize the dimensions. Used for an alloy or casting such as 6063, for which the effect of quenching can be realized by cooling after hot working (extrusion).
	T6	Hardened through artificial aging after solution treatment.	Excellent strength can be attained for a thermally treated alloy without cold working in the typical heat treatment process. An item that is given T6 treatment by a user under specified conditions is called T62.
	T61	Wrought Materials: Hardened through artificial aging after solution treatment by quenching with lukewarm water. Casting:Tempered after hardening	Quenched with lukewarm water to prevent distortion due to the main hardening. The conditions for hardening through artificial aging are adjusted to attain strength exceeding that accomplished by regular T6 treatment.
	T7	Stabilized after solution treatment	Overaging surpassing those needed for hardening through artificial aging is carried out to attain the maximum strength, because special properties are adjusted somewhat at the expense of strength.
	T73	Overaging after solution treatment.	Overaging after solution treatment to rectify the tendency to crack due to corrosion under stress. Specified in 7075, forgings, of JIS.
	T7352	Overaging after removal of residual stress after solution treatment.	Overaging after removal of residual stress by compression to retain 1% to 5% permanent deformation subsequent to solution treatment, in order to rectify the tendency to crack due to corrosion under stress. Included in free-forged part, 7075.
	T8	Hardened through artificial aging after cold working subsequent to solution treatment.	Cold working performed, with a noticeable effect, to improve the mechanical properties or to rectify drawbacks or improve dimension precision. Called T83 when the sectional area is reduced 3%through cold working. Called T86 when the reduction rate is 6%. These procedures are performed to enhance the strength.
	T9	Cold working after hardening through artificial aging subsequent to solution treatment.	Cold working is necessary to enhance the strength.

Materials

Hardening and Hardness Test Methods

■ Heat Treatment for Steel Materials

Name	Vickers Hardness (HV)	Hardening Depth (mm)	Strain	Applicable Materials	Typical Material	Reference
Through Hardening	750 or Less	Full Depth	Varies according to materials	High Carbon Steel C>0.45%	01 Tool Steel JIS-SKS21 52100 Bearing Steel M2 Tool Steel JIS-SKS93 W1-9 Tool Steel 1045 Carbon Steel	– Operation of heating copper to an appropriate temperature over transformation point and quickly cooling it in an appropriate medium in order to increase hardness or improve strength. – Not applicable to long or precision parts, such as spindles, etc.
Carburization	500 or Less	Standard 0.5 Up to 2	Moderate	Low Carbon Steel C<0.3%	SCM415 Alloy Steel JIS-SNCM220	– Applicable to partial hardening – Hardening depth should be specified on drawings – Applicable to precision parts
Induction Hardening	750 or Less	1~2	High	Medium Carbon Steel C 0.3~0.5%	1045 Carbon Steel	– A surface hardening method that uses high frequency induction current to quickly heat and cool the steel surface – Applicable to partial hardening – Expensive in small-volume lots – High fatigue resistance
Nitriding	900~1000	0.1~0.2	Low	Nitriding Steel	JIS-SCM645	– A surface hardening method that forms hardening layer of hard nitride compounds on the steel surface – Obtains highest degree of hardness among all hardening techniques – Fit for mass production – Applicable to spindles for sliding bearing
TUFFTRIDE is the trademark of Durferrit GmbH, Germany (salt bath process)	Carbon Steel 500 Stainless Steel 1000	0.01~0.02	Low	Steel Material	1045 Carbon Steel SCM415 Alloy Steel W1-10 Tool Steel Stainless Steel	– Tufftride is one of the nitriding methods called soft-nitriding (salt bath process) – High fatigue resistance and abrasion resistance – Same corrosion resistance as zinc plating – Not applicable to precision parts because of incapability of polishing after heat treatment –Applicable to oil free bearings.
Bluing	—	—	—	Wire Rod	JIS-SWP-B	– Low temperature annealing – Removes internal stress during forming to enhance elasticity

■ Hardness Test Methods and Applicable Parts

Testing Method	Principle	Applicable Heat-Treated Parts	Features	Reference
Brinell Hardness	– A (steel or super hard alloy) ball indenter is used to indent the test surface. Hardness is given as a quotient divided by the surface area of the dent, computed from the diameter.	– Annealing – Normalized parts – Anchored materials	– Applicable to uneven materials and forged products because indent is large – Not applicable to small or thin specimens	JIS Z2243
Rockwell Hardness	– This standard or test load is applied via a diamond or ball indenter. Hardness is read on a tester.	– Hardening tempered parts – Carburized surfaces – Nitrided parts – Thin sheets such as copper, brass, bronze, etc.	– Hardness value obtained quickly – Applicable to intermediate testing of actual products – Caution is required as there are 30 types	JIS Z2245
Shore Hardness	– The specimen is set on a table. A hammer is dropped from a uniform height. Hardness is based on how height the hammer bounces.	– Hardening tempered parts – Nitrided parts – Large carburized parts, etc.	– Extremely easy to operate and data can be obtained quickly – Applicable to large parts – Indent is kept shallow, therefore is applicable to actual products – Portable, as being compact and light weight	JIS Z2246
Vickers Hardness	– Uses a diamond 136°square pyramid indenter. Hardness value is obtained from the surface area of the dent, computed from the experimental load and the length of the diagonal lines of the dent. (Automatically calculated)	– This hardening layers by induction hardening, carburizing, nitriding, electrolytic plating, ceramic coating, etc. – Hardening layer depth in carburized and nitrided parts	– Applicable to small and thin specimens – Applicable to all materials because of diamond indenter	JIS Z2244

		Hexagonal Bar	Opposite Side H	3, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 17, 19, 21, 22, 23, 24, 26, 27, 29, 30, 32, 35, 36, 38, 41, 46, 50, 54, 55, 58, 60, 63, 65, 67, 70, 71, 75, 77, 80, 85, 90, 95, 100, 115
		Round Bar	D	2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 40, 42, 43, 44, 45, 46, 48, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 115, 120, 130, 140, 150, 160, 170, 180, 190, 200
Cold-Rolled Steel Plate	Low Carbon Steel	Steel Plate	t	0.4, 0.5, 0.6, 0.7, 0.8, 1, 1.2, 1.6, 2, 2.3, 3.2
Hot-Rolled Steel Plate	Low Carbon Steel	Steel Plate	t	(1.2), 1.6, 2.3, 2.6, 3.2, 4.5
Carbon Steel for Machine Structural Use	1045 Carbon Steel (Polished)	Round Bar	D	2, 2.5, 3, 3.5, 4, 4.5, 6, 7, 8, 9, 9.5, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, 36, 38, 40, 42, 44, 45, 46, 48, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 115, 120, 125, 130
	1049 Carbon Steel	Flat Bar	t	6, 9.5, 12.7, 13, 16, 19, 22, 25, 27, 32, 38, 45, 50, 55, 65, 75, 85, 95, 105, 115, 125, 135, 145, 155, (165), (175), (185), (205)
		Square Bar	—	12.7, 13, 16, 19, 25, 28, 32, 38, 44, 50, 55, 65, 75, 90, 100, 110, 120, 130, 155
Carbon Tool Steel	JIS-SKS93	Flat Bar	t	2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 16, 19, 22, 25, 27, 32, 38, 43, 50, 53, 65, 75, 90, 105, 130, 155
	JIS-SKS93	Square Bar	—	10, 13, 16, 19, 22, 25, 28, 32, 38, 45, 50, 55, 65, 75, 90, 105, 130, (155), (210)
	W1-9 Tool Steel -DG8	Round Bar	D	2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 28, 30, 32, 36, 38, 40, 42, 45, 48, 50, 55, 60, 65, 70, 75, 80
Alloy Tool Steel	01 Tool Steel	Flat Bar	t	2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 16, 19, 22, 25, 27, 32, 38, 43, 50, 53, 65, 75, 90, 105, 130, 155, (160)
		Square Bar	—	10, 13, 16, 19, 22, 25, 28, 32, 36, 38, 45, 50, 55, 65, 75, 90, 105, 130, (155), (210)
		Round Bar	D	13, 16, 19, 22, 25, 28, 32, 38, 42, 46, 50, 55, 60, 65, 70, 80, 85, 90, 100, 110, 120, 130, 150, 160, 180
Chrome Molybdenum Steel	4137 Alloy Steel	Hexagonal Bar	Opposite Side H	6, 7, 8, 9, 10, 11, 12, 13, 14, 17, 19, 21, 22, 23, 24, 26, 27, 30, 32, 35, 36, 38, 41, 46, 50, 54, 55
		Round Bar	D	4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 30, 32, 34, 35, 36, 38, 40, 42, 45, 46, 48, 50
Sulfuric and Sulfur Compound Free Cutting Steel	12L14 Carbon Steel	Round Bar	D	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 25, 26, 28, 30, 32, 34, 35, 36, 38, 40
High Carbon Chrome Bearing Steel	52100 Bearing Steel	Round Bar	D	13, 16, 19, 22, 25, 28, (30), 32, (34), 36, 38, 42, (44), 46, (48), 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 110, 120, 130, 140, 150, (160), (170), (180), (190), (200), (210), (220), (230), (240), (250)

Standard Material Sizes 2

■ Stainless Steel Materials

Type	Material Code	Shapes	Unit	Standard Dimensions
Austenite	303 Stainless Steel	Round Bar	D	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 28, 30
Austenite	304 Stainless Steel	Flat Bar	t	3, 4, 5, 6, 8, 9, 10, 12, 14, 15, 16, 19, 20, 22, 25, 28, 30, 35, 40, 45, 50, 55, 60, 70
		Square Bar	_	5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 19, 20, 22, 25, 28, 30, 32, 36, 38, 40, 45, 50, 60
		Hexagonal Bar	Opposite side H	8, 10, 14, 17, 19, 21, 22, 23, 24, 26, 29, 30, 32, 35, 36, 38, 41, 46
		Round Bar	D	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 28, 30, 32, 34, 35, 36, 38, 40, 42, 45, 46, 48, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, 200, 210, 220, 230
		Steel Plate	t	0.3, 0.4, 0.5, 0.6, 0.8, 1, 1.2, 1.5, 2, 2.5, 3, 4, 5, 6, 7, 8, 9, 10, 12, 15, 20

■ Copper Alloy Materials

Type	Material Code	Shapes	Unit	Standard Dimensions
Brass Plate	C28000 Brass	Steel Plate	t	0.1, 0.15, 0.2, 0.3, 0.4, 0.5, 0.8, 1, 1.2, 1.5, 1.6, 2, 2.3, 2.5, 3, 3.5, 4, 5, 6, 7, 8, 9, 10, 12, 15, 20, 25, 30, 40, 50
Free-Cutting Brass (Extruded Bar)	C3604 BD Brass (JIS)	Square Bar	—	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 28, 30, 32, 35, 36, 38, 40, 42, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100
		Hexagonal Bar	Opposite Side H	5, 5.5, 6, 7, 8, 9.5, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 34, 35, 36, 38, 40, 41, 42, 44, 45, 46, 50, 54, 55, 58, 60, 65, 70, 75, 80
		Round Bar	D	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 32, 33, 34, 35, 36, 38, 40, 42, 45, 46, 47, 48, 50, 51, 52, 53, 54, 55, 56, 57, 58, 60, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 115, 120, 125, 130, 135, 140, 145, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 270, 280, 300, 320, 350

■ Aluminum Alloy Materials

Type	Material Code	Shapes	Unit	Standard Dimensions
Al-Cu Alloy	2017 Aluminum Alloy	Flat Bar	t	0.5, 0.6, 0.8, 1, 1.2, 1.5, 1.6, 2, 2.5, 3, 4, 5, 6, 8, 10, 12, 15, 20, 25, 30, 40, 45, 50, 60, 70, 80, 90, 100
		Round Bar	D	5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 115, 120, 125, 130, 135, 140, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260, 280, 300
Al-Mg Alloy	5052 Aluminum Alloy	Flat Bar	t	0.4, 0.5, 0.6, 0.7, 0.8, 1, 1.2, 1.5, 1.6, 2, 3, 3.2, 4, 5, 6, 7, 8, 10, 12, 15, 16, 18, 20, 22, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 120, 130, 150, 160, 170, 180, 200
Al-Mg Alloy	5056 Aluminum Alloy	Round Bar	D	5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 70, 75, 80, 85, 90, 95, 100, 105, 110, 115, 120, 125, 130, 135, 140, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260, 270, 280, 290, 300, 310, 320, 330, 340, 350, 360, 370, 380, 390, 400, 420
Al-Mg-Si Alloy	6063 Aluminum Alloy	Square Bar	—	6, 8, 10, 12, 14, 15, 16, 18, 19, 20, 22, 25, 30, 32, 35, 40, 45, 50, 60, 70, 80, 100

■ Resin Type Materials

Type	Material Code	Shapes	Unit	Standard Dimensions
Laminated Sheet	Bakelite	Plate	t	(0.5), (0.6), 0.8, 1, 1.2, 1.5, 1.6, 2, 2.5, 3, 4, 5, 6, 8, 10, 12, 15, 16, 20, 25, 30, 35, 40, 50 Sizes in ( ) for cloth base only.
Polyamide Resin	Nylon 6, 66	Plate	t	5, 10, 15, 20, 25, 30, 40, 50
		Bar	D	6, 8, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 90, 100, 120, 140, 160, 180, 200
(MC Nylon)	MC Nylon	Plate	t	5, 7, 10, 12, 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 110, 120
		Bar	D	20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, 200, 225, 250, 275, 300, 325, 350, 375, 400, 450, 500, 600
Acetal Resin	Polyacetal	Plate	t	5, 6, 8, 10, 12, 15, 20, 25, 30, 35, 40, 50, 60, 70, 80, 90, 100
		Bar	D	4, 5, 6, 7, 8, 9, 10, 12, 12.5, 13, 15, 16, 17.5, 20, 22.5, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 100, 110, 120, (130), (140), 150, (160), (180), 200
General Methacrylic Resin Plate	Acrylic	Plate	t	0.8, 1, 1.5, 2, 3, 4, 5, 6, 8, 10, 15, 20, 25, 30

Names of Tool Steels

Rolled Steel for General Structure	SS400 . . . . . Steel, Structure, 400N/mm^2
Carbon Steel for Mechanical Structure	S45C . . . . . Steel, 0.45%C
Chrome Molybdenum Steel	SCM435. . . . . Steel, Cr, Mo 435
Nickel Chrome Molybdenum Steel	SNCM220 . . . . Steel, Ni, Cr, Mo 220
Carbon Tool Steel	SK105 . . . . . Steel, Tool (Kogu, in Japanese), Type105 (Old SK3)
Alloy Tool Steel	SKS3 . . . . . Steel, Tool (Kogu, in Japanese), Special, Type 3
Alloy Tool Steel	SKD11 . . . . . Steel, Tool (Kogu, in Japanese), Dies, Type 11
High-Speed Tool Steel	SKH51 . . . . . Steel, Tool (Kogu, in Japanese), High Speed, Type 51
High Carbon Chrome Bearing Steel	SUJ2 . . . . . Steel, Use, Bearing, Type 2
Stainless Steel	SUS304 . . . . . Steel, Use, Stainless, Type 304
Gray Cast Iron	FC250 . . . . . Ferrum (Iron), Cast, 250N/mm^2

Reference:"Special Steel", Nov. 2001

Matrix Group: This is a type of tool steels that has enhanced machinability and toughness by decreasing the large-size carbide responsible for expedited tool abrasion during a cutting process and flexibility reduction.

Machining Method		Equipment	Required Tool
Machining	Hole Machining on Side and Bottom	General Purpose Milling Cutter NC Milling Cutter Machining Center	Drills Reamer End Mills Cutting Tools
	Hole Machining	Drilling Machine Drill Press Boring Machine Jig Borer	Drills Tapped Reamer Cutting Tools
	Machining Cylinders	General Purpose Lathe NC Lathe Turning Center	Drills Reamer Tapped Cutting Tools
Grinding		Surface Grinder Cylindrical Grinder Jig Grinder Profile Grinder Forming Grinder	Grindstone
Electric Discharging		EDM	Electrode Master
		WEDM	Wire

NOTE: The complete Terms and Conditions applicable to the products and purchases from this catalog are found at: http://us.misumi-ec.com/contents/terms/.

Express Limited Warranty (Annex-B)

MISUMI USA, Inc. (the "Company") has a Mechanical Components for Assembly Automation Catalog (the "Catalog") that lists products for sale (the "Products") which are subject to the Terms and Conditions of Catalog Use (the "Terms and Conditions"). The Company provides an Express Limited Warranty (the "Limited Warranty") for Products that is further set forth in this Annex A. Customer, through their purchase of Products, agrees to be bound by this Limited Warranty. A manufacturer guarantee certificate or warranty may also apply to certain Products, which shall supersede and void this Limited Warranty as to such Product(s).

A. Scope of Limited Warranty

1. Company warrants that the Products shall be free of defects in material and workmanship. During the Warranty Periond, the Company at its sole discretion may repair or replace a Product with a defect attributable to the Company ("Defect") free of charge on condition that the customer provides the Company with written notice describing the alleged defect, within the warranty period (defined in the Limited Warranty), and the Company deems the alleged defect covered under this Limited Warranty. Minor flaws such as scratches, marks, dents or discoloration that do not affect the function of the Product do not constitute a Defect, unless the Company, in its sole discretion, deems such flaw to be a Defect.

2. **EXCLUSIONS**

This Limited Warranty does not cover damages or defects to Products resulting from or in any way contributed to:

(1) Use in devices that transport humans such as automobiles, vehicles, or ships; medical equipment with the purpose of curing or diagnosing humans; or general household consumer goods such as electronic and electric equipment.

(2) Use in aerospace equipment, nuclear energy equipment, or military-related products such as weapons or arms.

(3) Customer's reckless, negligent or abusive handling or use of the Product.

(4) Natural disasters including, but not limited to, earthquakes, fires and floods.

(5) Failure to comply with Product specifications, intended uses, Terms and Conditions, drawings; or documentation shipped with the Product or accessory.

(6) Any repair, modification, processing or disassembly of the Product.

(7) Damage to equipment other than the Product itself.

(8) Use outside of the country where the Company originally shipped the Product at the time of purchase.

B. Warranty Period

This Limited Warranty is valid for a period of one (1) year from the date Company ships Product to original purchaser.

C. Inspection and Notification

Within one (1) week of receipt of Product, customer should confirm the name, quantity and specifications of the Product(s) and check for any Defect. The customer must provide written notice to the Company within one (1) week of receipt of Product, or the Company may deem that the Product(s) are free from Defect.

D. Uncovered Products

The customer will be charged for all replacements and repairs of Product not covered by this Limited Warrarny.

E. LIMITATION OF LIABILITY

IN NO EVENT SHALL COMPANY BE LIABLE FOR ANY INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES, INCLUDING BUT NOT LIMITED TO, ANY CLAIMS OF PROPERTY DAMAGE, BASED UPON BREACH OF WARRANTY, BREACH OF CONTRACT, TORT, OR ANY OTHER LEGAL THEORY. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation may not apply to you.

F. LIMITATION OF WARRANTY

THIS LIMITED WARRANTY IS THE EXCLUSIVE WARRANTY FOR THE PRODUCT. COMPANY DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR PARTICULAR PURPOSE OR OTHERWISE. PRODUCTS ARE SOLD BUSINESS TO BUSINESS AND NOT TO CONSUMERS, RENDERING ANY CONSUMER LAW INAPPLICABLE. IN NO EVENT SHALL COMPANY'S LIABILITY WITH REGARD TO THE SALE OF PRODUCT EXCEED THE ORIGINAL PURCHASE PRICE PAID BY CUSTOMER.

G. ENTIRE AGREEMENT

This Limited Warranty contains and represents the only warranty extended by Company for the Product. No employee or agent of Company or any other party is authorized to make any other warranty in addition to those made in this Limited Warranty. This Limited Warranty gives you specific legal rights and you may also have other rights which vary from state to state.

H. MODIFICATION OR DISCONTINUATION OF PRODUCTS.

Company reserves the right to discontinue or modify the Product at any time without notice. In the event that repair or replacement of the Product pursuant to this Limited Warranty is not possible, Company will fulfill any repair or replacement obligation under this Limited Warranty with a product of equal or greater value.
