

# METALLIC SEALS FOR BEARINGS

## NILOS RINGS

NILOS RINGS THROUGHOUT THE WORLD

950-710

## STANDARD STYLES

NILOS Rings are available in two standard styles. The type with the sealing lip situated to bear on the outer ring of the bearing is indicated by the suffix "AV" in the NILOS part number.

Example: NILOS part number 6310 AV indicates an "outer ring sealing" NILOS Ring for a single row deep groove ball bearing. This bearing would commonly be identified as a "310" size.

The NILOS Ring design with the sealing lip situated to bear against the inner ring of the bearing is specified by the suffix "JV" in the NILOS part number.

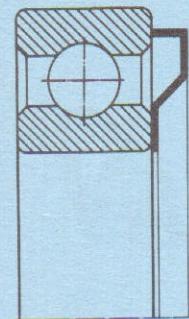

Example: NILOS part number 6310 JV indicates an "inner ring sealing" NILOS Ring for a single row deep groove ball bearing of the "310" size.

Both of the above described NILOS ring types may be employed for circumferential speeds up to 1000 surface feet per minute (see page 9). If higher speeds are anticipated, please so indicate when ordering so that the proper alterations in the NILOS design may be incorporated. As a general rule, it is more desirable to use the "JV" type of NILOS Ring as the sealing lip would be subjected to a smaller area of contact with the bearing ring.

## BEARINGS WITH INTEGRAL SHIELDS OR SEALS

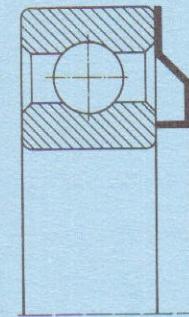

NILOS Rings are also available for bearings that are already equipped with integral shields or seals. For those bearings we supply a modified NILOS Ring with altered dimensions so that the shield or seal already in the bearing is not contacted by the sealing lip of our NILOS Ring. When dirt or condensation water can penetrate to a bearing, NILOS Rings are particularly indispensable. The all-metal NILOS Ring seal is often used to protect the integral seal already in the bearing. When NILOS Rings are used with bearings that have integral shields or seals the letter "Z" should be added to the part number. NILOS part number 6205 ZAV specifies an "outer ring sealing" NILOS Ring for a single row deep groove ball bearing of the "205" size with shields or seals. By the same token, NILOS part number 6205 ZJV specifies a similar NILOS Ring design with the sealing lip bearing on the inner ring of the same size bearing.

# AV

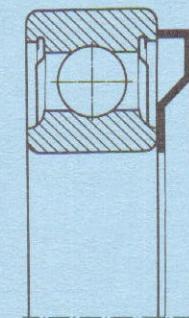

Dia. 1 NILOS Ring AV (outer ring sealing) fitted to a ball bearing

# JV

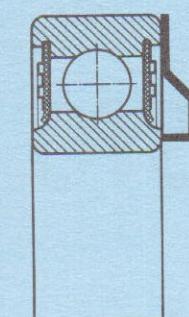

Dia. 2 NILOS Ring JV (inner ring sealing) fitted to a ball bearing

# ZAV

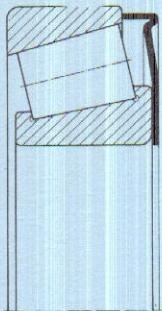

Dia. 3 NILOS Ring ZAV (outer ring sealing) fitted to a ball bearing with shields on both sides

# ZJV

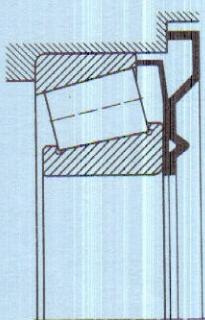

Dia. 4 NILOS Ring ZJV (inner ring sealing) fitted to a ball bearing with integral seals on both sides

# AV

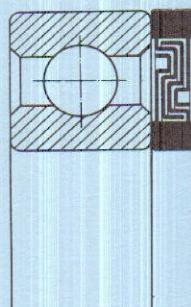

Dia. 5 NILOS Ring AV (cup sealing) fitted to a taper roller bearing

# AK

Dia. 6 NILOS Ring AK (double outer sealing lips) fitted to a taper roller bearing

# LSTO

Dia. 7 NILOS Ring LSTO (labyrinth sealing) fitted to a ball bearing

## TAPER ROLLER BEARINGS

For taper roller bearings there is a type "AV" NILOS Ring that may be mounted on one side of the bearing. Because of the offset nature of the cone and cup on a taper roller bearing, the design of this NILOS Ring differs from those that would be used for ball or straight roller bearings. However, the ring is dimensioned and styled in such a manner that the sealing edge is always reliably in contact with the cup and, therefore, guarantees efficient sealing.

NILOS Rings, the sealing lip of which bears on the cup of a taper roller bearing, are specified by the suffix "AV" in the part number.

Example: NILOS part number 525/522 AV specifies a "cup sealing" NILOS Ring for an inch size taper roller bearing 525/522.

A second type of NILOS Ring design for taper roller bearings is specified by the suffix "AK". This style of ring is comprised of two closely connected sealing disks. The two disks are spot welded together. The outer piece has two locking dimples on the clamping surface.

Example: NILOS part number 418/414 AK specifies a NILOS seal with two sealing lips for taper roller bearing 418/414; one bears on the cup and the other on the housing (see sketch page 34).

## NILOS LABYRINTH SEAL

NILOS Labyrinth Seal Ring Type LSTO consists of packings of laminated steel disks. This is not a contact type seal as the types previously described. It is provided with steel cores and is resistant to axial pressure. Thus, any axial movement of the bearing itself will not have a squeezing effect on the labyrinth section.

The NILOS seal LSTO is particularly desirable for applications which are exposed to extremely contaminated conditions. See detailed explanations pages 39 to 42).

Example: NILOS part number 30 x 55 LSTO specifies a labyrinth sealing for either ball or roller bearings with 30 mm I. D. and 55 mm O. D.

For trouble free service life of the equipment that you are producing, the right bearing, lubricant and seal are of the greatest importance. We have had thousands of individual experiences with the successful sealing of bearings with NILOS Rings. Do not hesitate to let us help you with your seal problems.

#### **What they will do:**

The NILOS Ring is a bearing seal that protects efficiently against the entry of all kinds of foreign matter into the bearing. Being entirely made of galvanized steel it is a particularly effective protection against tough abrasive particles. It will retain grease in a bearing but will not work with oil lubricated bearings.

#### **Sealing Effect**

The sealing is attained by the sealing edge rotating under slight pressure against either the inner or outer bearing ring. This results in a shallow groove worn in the hardened bearing ring and so producing a miniature labyrinth. This small labyrinth prevents loss of the bearing grease and keeps out foreign matter. In order to prevent the sealing edge from sticking during its running-in period the recessed area of the NILOS Ring must be filled with grease when installed. Once run-in the NILOS Ring needs no further attendance.

If the bearing application permits, it is better to use an inner ring sealing NILOS Ring type "JV" because it has a smaller sealing edge and the position of the sealing edge with regard to the centrifugal force of the lubricant is much more effective.

In the running-in and groove-forming process minute metal particles (approx. the consistency of fine powder) are formed. Normally these tiny particles are deposited on the outside of the sealing lip. Any of these particles that are directed inside the sealing are trapped in the grease, located in the recessed area of the NILOS Ring and do not affect the performance of the bearing.

#### **Scope of the List**

This catalog is arranged to specify the appropriate NILOS Rings for ball and roller bearings most commonly in use. Please inquire for NILOS Ring sizes which are not indicated as many are now available.

#### **Bearing Speed may be a Factor**

NILOS Rings are available for all bearing speeds. The standard catalog NILOS Ring is suitable for a maximum of 1000 surface feet per minute. In case of higher speed please check with us for engineering advise.

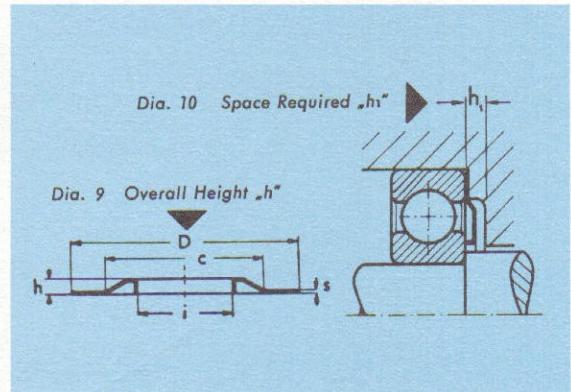

#### **Basic Rule: Concentric Location**

The sealing edge of the NILOS Ring must run perfectly concentric in order to form a miniature labyrinth groove. With an "AV" NILOS Ring the bore of the ring itself must fit closely to the shaft. In case of the "JV" NILOS Ring the outside edge of the ring itself is located by the housing. In either case the locating diameter must not be located in keyways or grooves etc.

#### Overall Height "h" Space Required "h<sub>1</sub>"

The space required to mount a NILOS Ring is very small and the method of fitting is very simple. These two advantages in many cases allow NILOS Rings to be fitted without alteration to existing design. The dimension "h<sub>1</sub>" = h + 1 mm must be strictly observed. This will ensure that there is no possibility of distorting the NILOS Ring.

#### Lubrication of Bearings

Ball and roller bearings should be filled from 30 per cent to 50 per cent generally with bearing grease. Overgreasing involves excessive heating of bearing, the lubricant will break down and lose effectiveness.

#### Slip-Proof Clamping Required

The NILOS Ring must not turn when fixed to its clamping surface. Normally the snug fit of the bearing against the shaft collar for the outside sealing ring (type AV) and the usual clamping elements for the inside sealing ring (type JV) will suffice.

#### Identification Marking on Bearing Ring

The NILOS Ring should, when possible, be mounted on the side of the bearing, that does not contain the bearing identification number or name. If this cannot be avoided (as with double sealed bearings), the bearing should be installed in such a way that the marked ring side is towards the inside of the housing, or to the side least exposed to dirt etc.

#### Self-aligning and Spherical Roller Bearings

NILOS Rings cannot be used on bearings making self-aligning movements. Self-aligning and spherical roller bearings are, however, used for their greater load carrying capacity on many applications where misaligning is not involved. In these cases NILOS Rings are perfectly safe.

#### Cylindrical Roller Bearings without Flange

For these and for a number of similar bearings we suggest the use of the NILOS seal LSTO which is better equipped to follow the axial movements.

#### Taper Roller Bearings

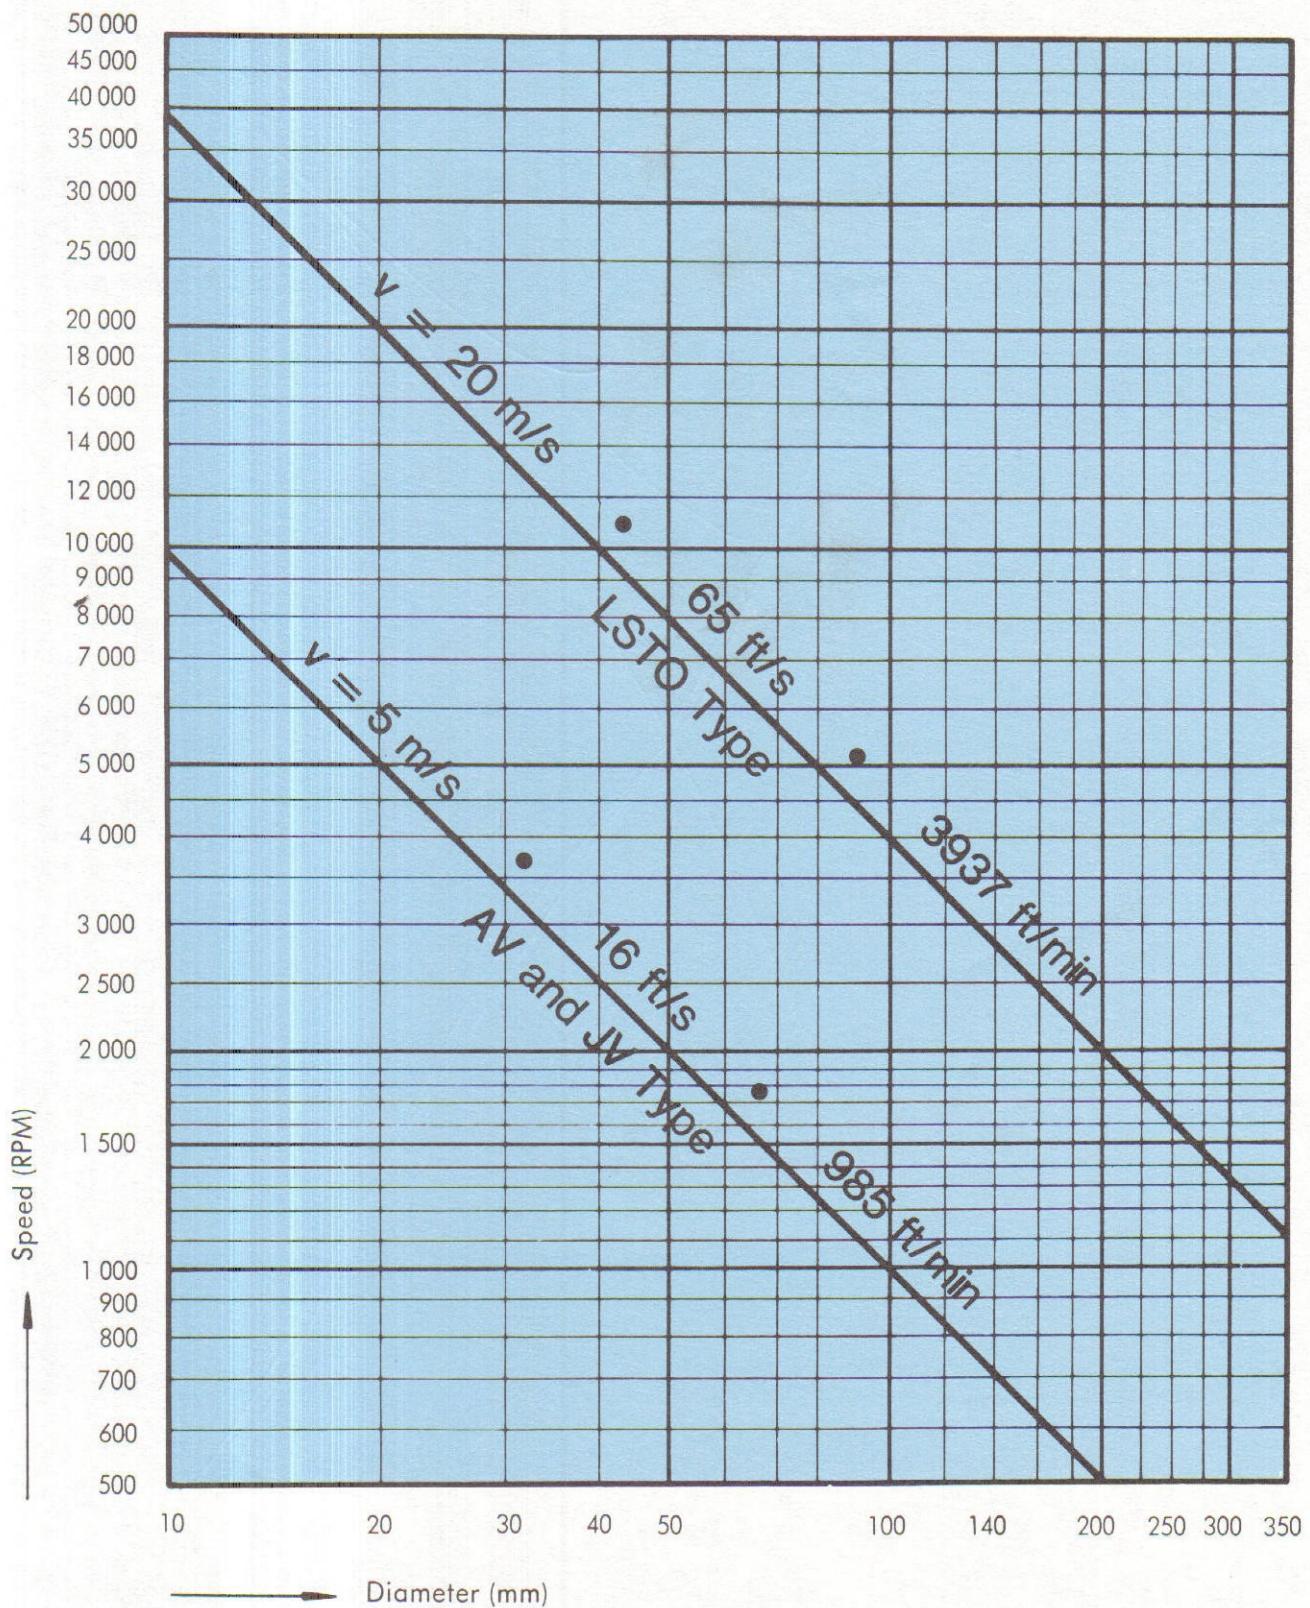

Taper roller bearings can be sealed by NILOS Rings type AV and AK. The mounting of the taper roller bearing and of the NILOS Ring should be made with special care to avoid damaging of the sealing edge.

Please note the suggestions on fitting of taper roller bearings on page 11.

#### Special Types

In addition to the types listed, we also manufacture many special types of NILOS Rings. If you have application requiring special rings please let us have drawings giving details concerning conditions, number of revolutions, etc.

# SPEED DIAGRAM

**NILOS STANDARD STYLES**

Velocity  $v = 5 \text{ m/s}$  for NILOS Rings AV (diameter a) and JV (diameter i)

**NILOS LABYRINTH SEAL**

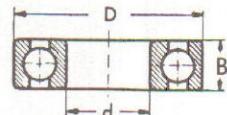

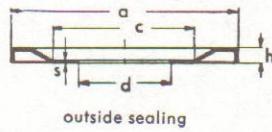

Velocity  $v = 20 \text{ m/s}$  for NILOS Rings LSTO (diameter  $\frac{D + d}{2}$ )

In case of higher velocity please check with us for engineering advise.

## EXPLANATIONS

The NILOS Ring LSTO accomplishes in a nearly ideal manner the requirements expected from a seal for grease-lubricated anti-friction bearings. Its construction includes the following outstanding features:

1. A labyrinth system a most effective sealing device that provides exclusion of foreign matter of any kind and size.
2. The grease within the seal prevents entry of water and liquid splashing.
3. The all-steel construction is inherently durable and capable of withstanding high temperatures.
4. The inner and outer diameter of the LSTO seal correspond to the dimensions of the bearing.
5. LSTO seals have a uniform narrow width of 4 mm (0.1575") and thus require very little space to accomodate them.
6. Coefficient of friction is nearly 0; hence, LSTO seals are suitable for high speeds.
7. As the NILOS ring LSTO produces no friction of its own it does not add any heat to the assembly.
8. Any axial movements of a ball bearing have no influence on the NILOS LSTO seal.

As already outlined in the preceding points the NILOS seal LSTO is a grease-filled labyrinth seal and is delivered as a compact, self-contained, mountable unit. This seal has been developed especially for bearings which are exposed to extreme conditions. The NILOS seal LSTO has proved its efficiency to seal grease-lubricated bearings in agricultural and construction machinery, conveying equipment of all kinds, including those which are used with drying ovens, as well as in many other machines and appliances.

In general, mounting of the NILOS seal LSTO will be made directly adjacent to the bearing. The LSTO seal has to be clamped absolutely slip-tight on the side faces of the inner and outer rings of the seal. The procedure of slip-tight fitting

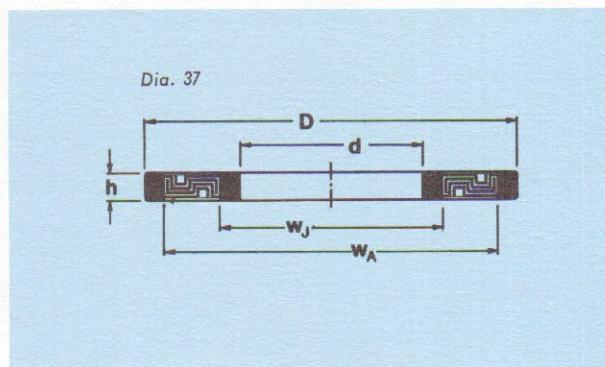

## NILOS RINGS LSTO

can be accomplished by an axially threaded bushing or a spacer. In other words the LSTO seal may be positioned by axial clamping (locking rings, for instance) as well as by press-fit on the bore and outer diameter. If the LSTO seal is mounted with a proper press-fit on the bore and outer diameter additional axial clamping is unnecessary.

If axial clamping is used in mounting the NILOS seal LSTO the subsequent pressure is applied to the inner and outer steel core rings only and therefore the clamping pressure will not affect the labyrinth seal area.

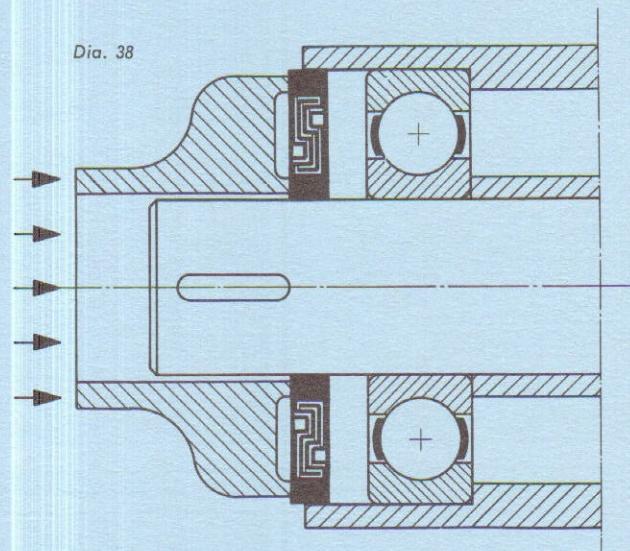

If the LSTO seal is clamped in an axial manner please pay attention to the dimensions  $W_A$  and  $W_J$  in the table so that the bushings or shoulders cannot interfere with the labyrinth area of the seal.

As further protection a NILOS Ring type AV or JV may be added to the NILOS Ring type LSTO. Should such a combination of a NILOS Ring LSTO with a NILOS Ring AV or JV be used these rings must be ordered together as, in this event, some dimensions have to be adjusted. In the application examples there is one illustration of a combination of a NILOS Ring type LSTO with a NILOS Ring type AV. (see page 13). Please consult us for additional engineering information if you have a similar application.

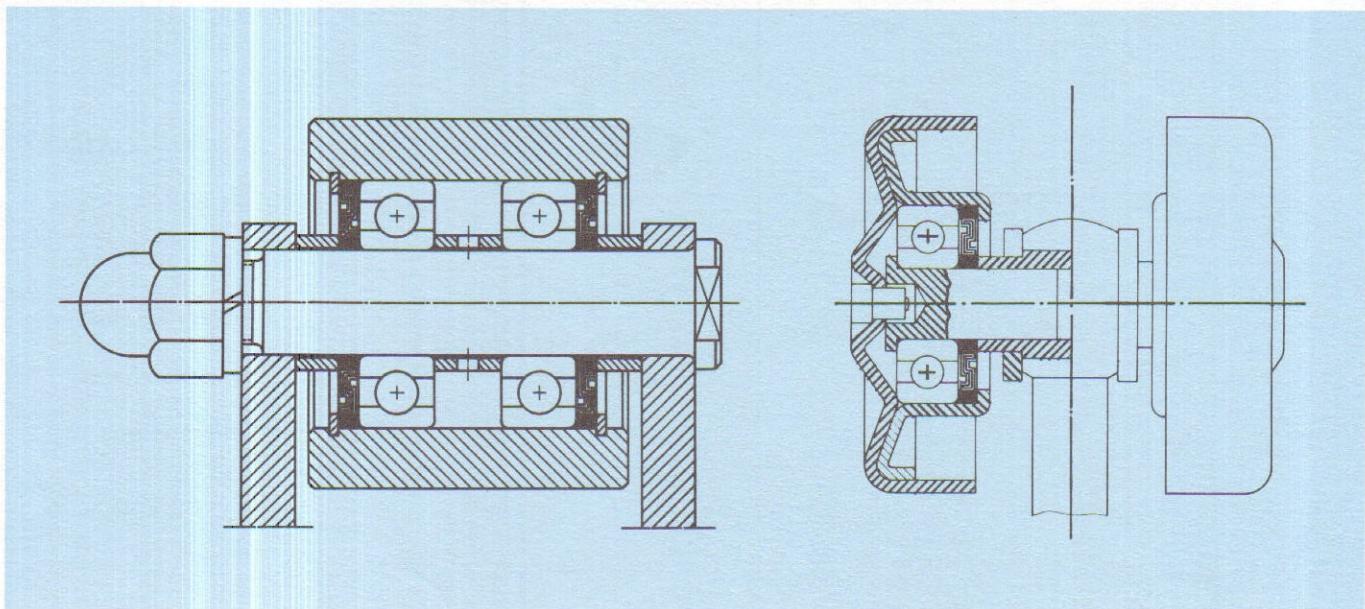

## FITTING

The NILOS seal LSTO must always be mounted square to shaft and housing and must not be cocked. It is desirable to use a mounting tool. We suggest that you employ the same tool as might be used to mount the bearing. The following illustration shows the correct fitting of the NILOS seal LSTO.

## TYPICAL APPLICATIONS FOR NILOS RINGS LSTO

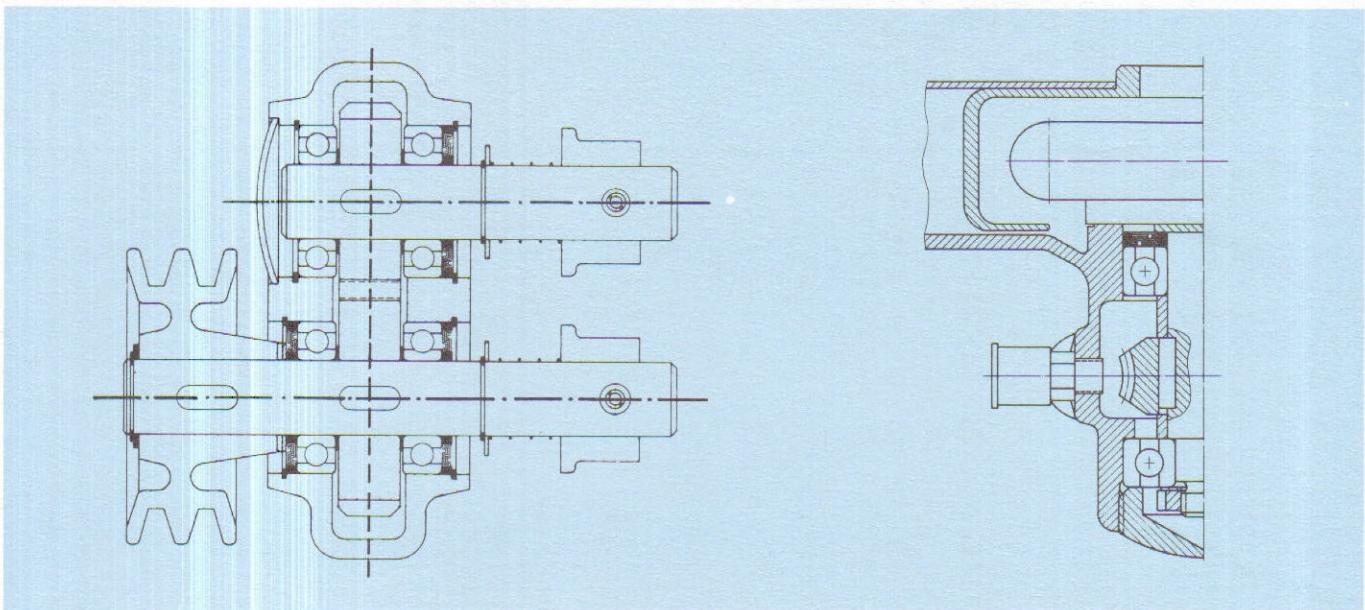

Dia. 39

NILOS Rings provide a reliable sealing for chain guide rollers of circular conveyors.

Dia. 40

Even under extreme heat, as can be the case with guide rollers NILOS Rings provide an effective maintenance-free seal.

Dia. 41

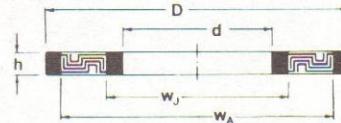

NILOS Rings have proved their efficiency in agricultural machinery and offer excellent protection on the gear box bearings of a hay rake.

Dia. 42

Bearings of rock drilling machines are exposed to very severe conditions of extreme vibration and abrasive particles. NILOS Rings have proved their reliability of protecting the bearings on this kind of equipment.
