# NB LINEAR SYSTEM

The NB linear system is a linear motion mechanism which utilizes the rotational motion of ball and/or roller elements. NB offers a wide range of linear motion products of high precision quality that contribute to the size and weight reduction of machinery and equipment.

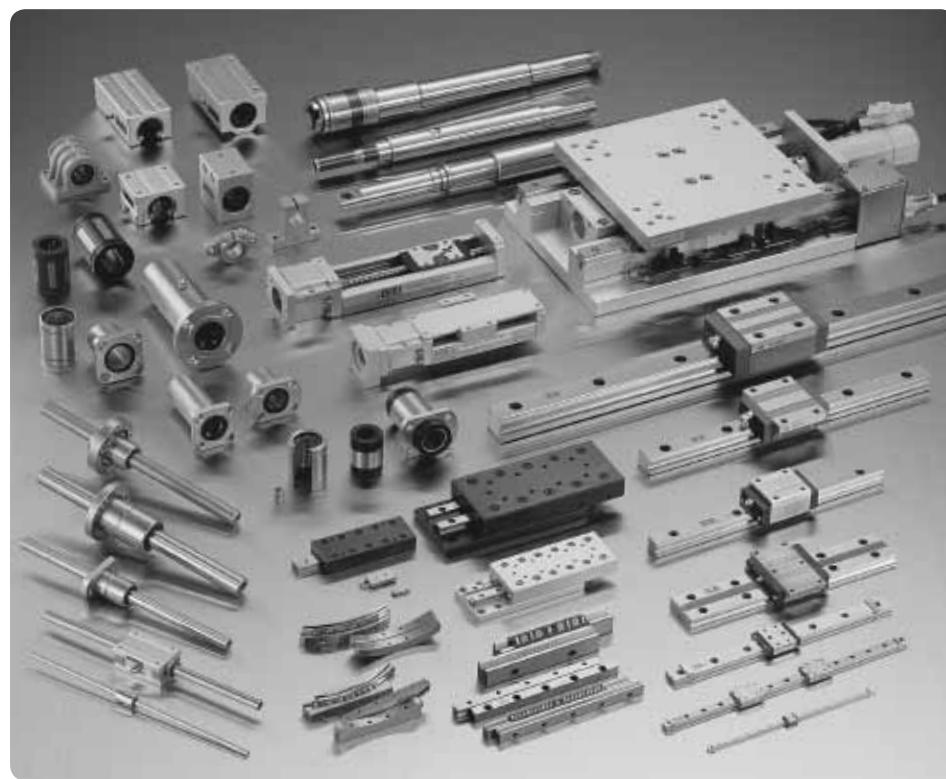

## ADVANTAGES

### Low Friction and Excellent Response

The dynamic friction of the ball or roller elements is substantially lower than that of full-face surface sliding friction. Since the difference between dynamic and static frictional resistance is small, motion response is excellent in terms of positioning accuracy and in high speed applications with acceleration and deceleration.

### High Precision and Smooth Movement

The NB linear system is designed for the rolling elements to achieve extremely smooth motion. The raceway surface is finished by precision grinding for high precision movement with optimal clearance.

### High Load Capacity and Long Travel Life

Despite the compactness of the NB linear system, the system uses relatively large rolling elements on a long raceway resulting in a high load capacity and a long travel life.

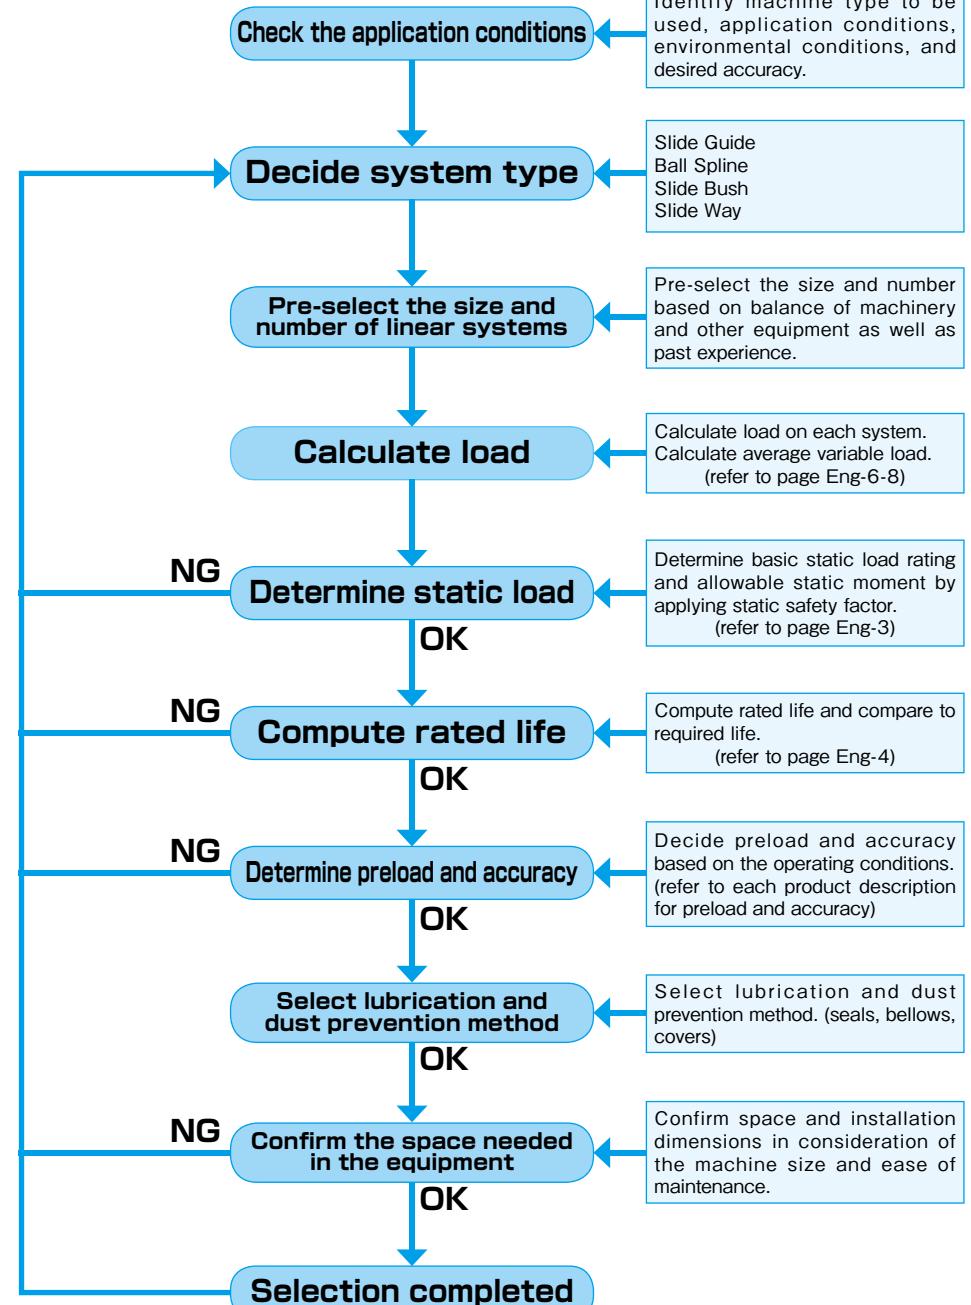

### Ease of Installation

The NB linear system shortens machining and assembly time compared with that of a full-face surface sliding bearing.

### Variety of Types

A wide variety of types and sizes of the NB linear systems are available to best serve the purpose for every application and requirement.

## PROCESS FOR SELECTING NB LINEAR SYSTEM

## ALLOWABLE LOAD

### Load and Moment

A load is applied to the linear system as Figure 1-1 shows. Sometimes moment loads are applied to, for example, slide guides. Load and moment are defined as follows.

### Basic Static Load Rating (compliant with ISO14728-2<sup>\*1</sup>) and Allowable Static Moment

When excess load or impact load is applied to the linear system while it is stationary or moving slowly, a permanent deformation occurs on the rolling elements and the race way.

If this deformation exceeds a certain limit, it causes vibration and noise during operation resulting in a non-smooth motion and a shorter life time. To prevent this permanent deformation and deterioration in motion accuracy, the basic static load rating ( $C_0$ ) is given as the allowable load for the linear system. This basic static load rating is defined as the static load that results in the maximum allowable stress at the center of the contact surface between the rolling elements and the race way. The sum of the permanent deformation of the rolling element and that of the race way is 0.0001 times the diameter of the rolling element. In the linear system, a moment load may be present in addition to the static load. The allowable static moments are defined by  $M_p$ ,  $M_y$ , and  $M_R$  as illustrated in Figure 1-1.

\*1: This does not apply to some products.

### Allowable Load and Static Safety Factor

The basic static load rating and allowable static moment define the maximum static load in each direction, however, these maximum static loads are not necessarily applicable depending on the operating conditions, the mounting accuracy, and the required motion accuracy. Therefore, an allowable load with a safety factor must be obtained. The minimum static safety factor is listed in Table 1-1.

#### Allowable Load

$$P_{max} \leq C_0 / fs \quad \dots \dots \dots (1)$$

#### Allowable Moment

$$M_{max} \leq (M_p, M_y, M_R, M_{p2}, M_{y2}) / fs \quad \dots \dots \dots (2)$$

$fs$ : static safety factor  $C_0$ : basic static load rating (N)

$P_{max}$ : allowable load (N)

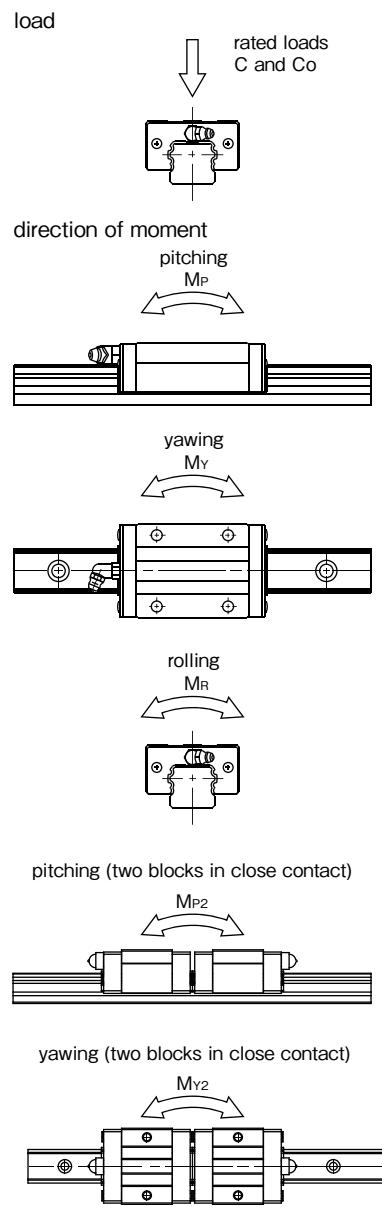

$M_p, M_R, M_y, M_{p2}, M_{y2}$ : allowable static moment (N · m)

$M_{max}$ : allowable moment (N · m)

Table 1-1 Minimum Static Safety Factor (fs)

operating conditions	static safety factor
normal	1~2
smooth motion required	2~4
vibration/impact loading	3~5

Figure 1-1 Load and Moment

## LIFE

### Life of a Linear System

When a linear system reciprocates under loading, a continuous stress acts on it, ultimately causing flaking of its race way surface due to material fatigue. The distance a linear system travels before this flaking occurs is defined as the life of the linear system. A linear system can also become inoperable due to sintering, cracking, pitting, or rusting, however, these causes are differentiated from flaking because they are related to installation accuracy, operating environment, and relubrication method.

### Rated Life

Even when a group of linear systems from the same production lot operated under identical conditions, the life time can differ due to differences in the material fatigue failure characteristics. This fact prevents from determining the exact life time of a single linear system for use. Therefore, the rated life is defined statistically as the distance of 90% of the linear systems travel before causing flaking.

### Basic Dynamic Load Rating (compliant with ISO14728-1<sup>\*2</sup>) and Basic Dynamic Torque Rating

The life of a linear system is expressed in terms of the distance traveled. Therefore, the life of a linear system is calculated reversely by using the allowable load that achieves a certain travel distance. This allowable load is called the basic dynamic load rating. The basic dynamic load rating is defined as a constant load in weight and direction that can achieve a travel distance of  $50 \times 10^3$ m on the linear system. NB assumes the load is applied from the top as a normal radial load, because basic dynamic load ratings change depending on the applied load direction. The basic dynamic load ratings in the dimensional tables are based on this assumption. Ball splines can carry torque loading, so the basic dynamic torque rating is defined for the Ball Spline.

\*2: This does not apply to some products.

### Rated Life Estimation

The rated life estimation depends on the type of the rolling element. Equations (3) and (4) are used for the ball element and for the roller element, respectively. Equation (5) is used when torque loading is present.

balls are used as the rolling element

$$L = \left( \frac{C}{P} \right)^3 \cdot 50 \quad \dots \dots \dots (3)$$

rollers are used as the rolling element

$$L = \left( \frac{C}{P} \right)^{10/3} \cdot 50 \quad \dots \dots \dots (4)$$

torque loading is present

$$L = \left( \frac{C_T}{T} \right)^3 \cdot 50 \quad \dots \dots \dots (5)$$

L: rated life (km) C: basic dynamic load rating (N)

P: applied load (N) C<sub>T</sub>: basic dynamic torque rating (N · m)

T: applied torque (N · m)

In the actual application, numerous variable factors are present such as in guide rail/shaft accuracy, in mounting conditions, in operating conditions, vibration and shock, etc. Therefore, calculating the actual applied load accurately is extremely difficult. In general, the calculation is simplified by using coefficients representing these factors: hardness coefficient ( $f_H$ ), temperature coefficient ( $f_T$ ), contact coefficient ( $f_C$ ), and applied load coefficient ( $f_w$ ). Taking these coefficients into account, Equations (3) to (5) become Equations (6) to (8).

balls are used as the rolling element

$$L = \left( \frac{f_H \cdot f_T \cdot f_C \cdot C}{f_w P} \right)^3 \cdot 50 \quad \dots \dots \dots (6)$$

rollers are used as the rolling element

$$L = \left( \frac{f_H \cdot f_T \cdot f_C \cdot C}{f_w P} \right)^{10/3} \cdot 50 \quad \dots \dots \dots (7)$$

torque loading is present

$$L = \left( \frac{f_H \cdot f_T \cdot f_C \cdot C_T}{f_w T} \right)^3 \cdot 50 \quad \dots \dots \dots (8)$$

L: rated life (km) f<sub>H</sub>: hardness coefficient

f<sub>T</sub>: temperature coefficient f<sub>C</sub>: contact coefficient

f<sub>w</sub>: applied load coefficient P: applied load (N)

C: basic dynamic load rating (N)

C<sub>T</sub>: basic dynamic torque rating (N · m)

T: applied torque (N · m)

When the travel distance per unit time is constant, the rated life can be expressed in terms of time (hour). Equation (9) shows the relationship between stroke length, number of cycles per minute, and the life time.

#### • Hardness Coefficient ( $f_H$ )

In the linear system, the guide rail or shaft works as race way of the rolling elements. Therefore, the hardness of the rail or shaft is an important factor in determining the rated load. The rated load decreases as the hardness decrease below 58HRC. NB products hold appropriate hardness by advanced heat treatment technology. In case of using the rail or shaft of insufficient hardness, please take the hardness coefficient (Figure 1-2) into the life calculation equation.

#### • Temperature Coefficient ( $f_T$ )

In order to give low wear characteristics NB products are hardened by heat treatment. If the temperature of the linear system exceeds 100°C, the hardness is decreased by tempering effect, so as the rated load decreases. Figure 1-3 shows the temperature coefficient as hardness changes with temperature.

#### • Contact Coefficient ( $f_C$ )

When more than one bearing is used in close contact, the contact coefficient should be taken into consideration due to the variation of products and the accuracy of the mounting surface. Table 1-2 shows the contact coefficient for life calculation.

#### • Applied Load Coefficient ( $f_W$ )

When calculating the applied load, the weight of the mass, inertial force, moment resulting from the motion, and the variation with time should be accurately estimated. However, it is very difficult to accurately estimate the applied load due to the existence of numerous variables, including the start/stop conditions of the reciprocating motion and of the shock/vibration. Estimation is simplified by using the values given in Table 1-3.

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60} \quad \dots \dots \dots \quad (9)$$

$L_h$ : life time (hr)  
 $l_s$ : stroke length (m)  
 $n_1$ : number of cycles per minute (cpm)

Figure 1-2 Hardness Coefficient

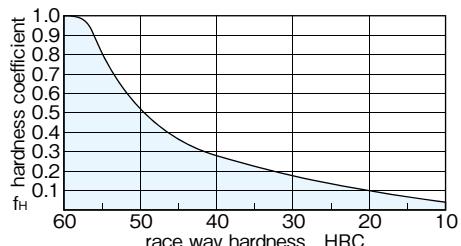

Figure 1-3 Temperature Coefficient

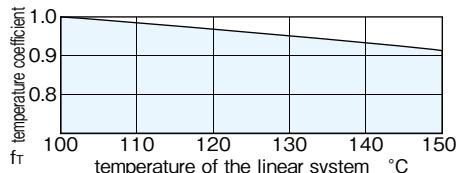

Table 1-2 Contact Coefficient

number of linear bearings in close contact on rail/shaft	contact coefficient $f_C$
1	1.00
2	0.81
3	0.72
4	0.66
5	0.61

Table 1-3 Applied Load Coefficient

operating conditions	applied load coefficient $f_W$	
loading	velocity	
no shock and vibration	15 m/min or less	1.0~1.5
low shock and vibration	60 m/min or less	1.5~2.0
high shock and vibration	60 m/min or more	2.0~3.5

#### Calculation of Applied Load (1)

Tables 1-4 and 1-5 show the formulas of applied load calculation for typical applications.

$W$ : applied load (N)  $P_1 - P_4$ : load applied to linear system (N)  $X, Y$ : linear system span (mm)  
 $x, y, \ell$ : distance to applied load or to working center of gravity (mm)  $g$ : gravitational acceleration ( $9.8 \times 10^3 \text{ mm/s}^2$ )  
 $V$ : velocity (mm/s)  $t_i$ : acceleration time (sec)  $t_s$ : deceleration time (sec)

Table 1-4 Applied Load Calculation (1)

condition	applied load calculation formula
2 horizontal axes	$P_1 = \frac{1}{4}W + \frac{x_0}{2X}W + \frac{y_0}{2Y}W$ $P_2 = \frac{1}{4}W - \frac{x_0}{2X}W + \frac{y_0}{2Y}W$ $P_3 = \frac{1}{4}W + \frac{x_0}{2X}W - \frac{y_0}{2Y}W$ $P_4 = \frac{1}{4}W - \frac{x_0}{2X}W - \frac{y_0}{2Y}W$
2 horizontal axes, over-hang	
under static conditions or constant velocity motion	

Note : If the calculation results in a negative value, the loading direction is in the opposite direction.

$$P_1 = \frac{1}{4}W + \frac{x_0}{2X}W + \frac{y_0}{2Y}W$$

$$P_2 = \frac{1}{4}W - \frac{x_0}{2X}W + \frac{y_0}{2Y}W$$

$$P_3 = \frac{1}{4}W + \frac{x_0}{2X}W - \frac{y_0}{2Y}W$$

$$P_4 = \frac{1}{4}W - \frac{x_0}{2X}W - \frac{y_0}{2Y}W$$

Table 1-5 Applied Load Calculation (2)

	condition	applied load calculation formula
under static conditions or constant velocity motion	2 horizontal, side axes 	$P_1 = P_2 = P_3 = P_4 = \frac{l_1}{2Y}W$ $P_{1S} = P_{3S} = \frac{1}{4}W + \frac{x_0}{2X}W$ $P_{2S} = P_{4S} = \frac{1}{4}W - \frac{x_0}{2X}W$
under static conditions or constant velocity motion	2 vertical axes 	$P_1 = P_2 = P_3 = P_4 = \frac{l_1}{2X}W$ $P_{1S} = P_{2S} = P_{3S} = P_{4S} = \frac{l_2}{2X}W$
under constant acceleration conditions	2 horizontal axes 	under acceleration $P_1 = P_3 = \frac{1}{4}W\left(1 + \frac{2V_1l_1}{gt_1X}\right)$ $P_2 = P_4 = \frac{1}{4}W\left(1 - \frac{2V_1l_1}{gt_1X}\right)$ under deceleration $P_1 = P_3 = \frac{1}{4}W\left(1 - \frac{2V_1l_1}{gt_3X}\right)$ $P_2 = P_4 = \frac{1}{4}W\left(1 + \frac{2V_1l_1}{gt_3X}\right)$ under constant velocity $P_1 = P_2 = P_3 = P_4 = \frac{1}{4}W$ ※g: acceleration of gravity ( $9.8 \times 10^3 \text{ mm/sec}^2$ )

### • Equivalent Coefficient

The linear systems are generally used with two axes, each axis with a couple of bearings installed. However, due to a space limitation, there must be an application in which one axis with one or two bearings in close contact installed. In such a case, multiply the applied moment by the equivalent moment coefficient shown in Tables 1-7~1-25 for applied load calculation. The following is a formula for calculating the equivalent moment load when a moment is applied to the linear system.

$$P = E \cdot M$$

P: equivalent moment load per bearing (N)  
E: equivalent moment coefficient  
M: applied moment (N · mm)

### Calculation of Applied Load (2)

Table 1-6 shows the formulas for determining the applied load when moment is applied to the linear system.

W: applied load (N) P: load applied to the linear system (N) l: distance to applied load or to working center of gravity (mm)

Table 1-6 Applied Load Calculation (3)

	condition	applied load calculation formula

## Average Applied Load

The load applied to a linear system generally varies with the travel distance depending on how the system is operated. This includes the start/stop processes of the reciprocating motion and work on the system. The average applied load is used to compute the life corresponding to the actual application conditions.

- ① When the load varies in a step manner with the travel distance (Figure 1-7).

$\ell_1$  is the travel distance under load  $P_1$

$\ell_2$  is the travel distance under load  $P_2$

$\vdots$

$\ell_n$  is the travel distance under load  $P_n$

The average applied load  $P_m$  is obtained by the following equation.

$$P_m = \frac{1}{\ell} (P_1^3 \ell_1 + P_2^3 \ell_2 + \dots + P_n^3 \ell_n) \dots (10)$$

$P_m$ : average applied load (N)  $\ell$ : total travel distance (m)

- ② When the applied load varies linearly with the travel distance (Figure 1-8), the average applied load  $P_m$  is approximated by the following equation.

$$P_m = \frac{1}{3} (P_{\min} + 2P_{\max}) \dots (11)$$

$P_{\min}$ : minimum applied load (N)

$P_{\max}$ : maximum applied load (N)

- ③ When the applied load draws a sine-curve as shown by Figures 1-9 (a) and (b), the average applied load  $P_m$  is approximated by the following equations.

$$P_m = 0.65P_{\max} \dots (12)$$

$$P_m = 0.75P_{\max} \dots (13)$$

Figure 1-7 Applied Load Varies Stepwise

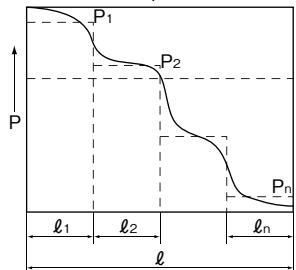

Figure 1-8 Applied Load Varies Linearly

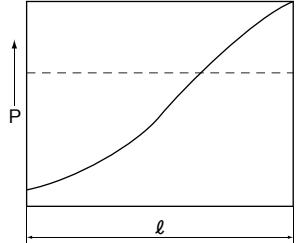

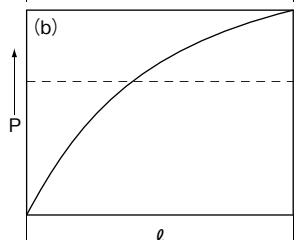

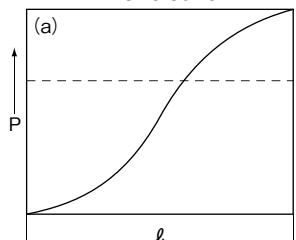

Figure 1-9 Applied Load Varies Sine-Curve

## RATED LIFE CALCULATION EXAMPLE 1

### 2 Horizontal Axes, 2 Blocks each, Considering Acceleration/Deceleration

#### Operating Conditions

part number: SGL15F/E

basic dynamic load rating  $C = 7.29\text{kN}$

basic static load rating  $C_0 = 9.45\text{kN}$

guide block span:  $L_{\text{unit}} = 100\text{mm}$

guide rail span:  $L_{\text{rail}} = 100\text{mm}$

drive:  $Y_d = 10\text{mm}$

$Z_d = -10\text{mm}$

mass:  $m_1 = 30\text{kg}$   $X_1 = 15\text{mm}$

$Y_1 = -20\text{mm}$

$Z_1 = 20\text{mm}$

$m_2 = 15\text{kg}$   $X_2 = 80\text{mm}$

$Y_2 = 50\text{mm}$

$Z_2 = 100\text{mm}$

velocity:  $V_{\max} = 200\text{mm/s}$

time:  $t_1 = 0.2\text{s}$

$t_2 = 3.3\text{s}$

$t_3 = 0.2\text{s}$

acceleration:  $a_1 = 1.0\text{m/s}^2$

$a_3 = 1.0\text{m/s}^2$

stroke:  $L_s = 700\text{mm}$

number of cycles per minute:  $n_1 = 8\text{cpm}$

Figure 1-10

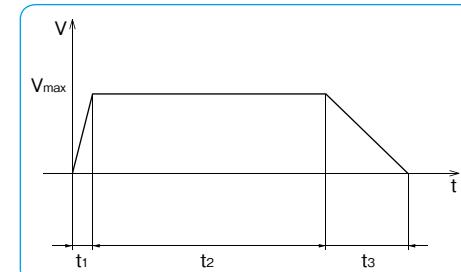

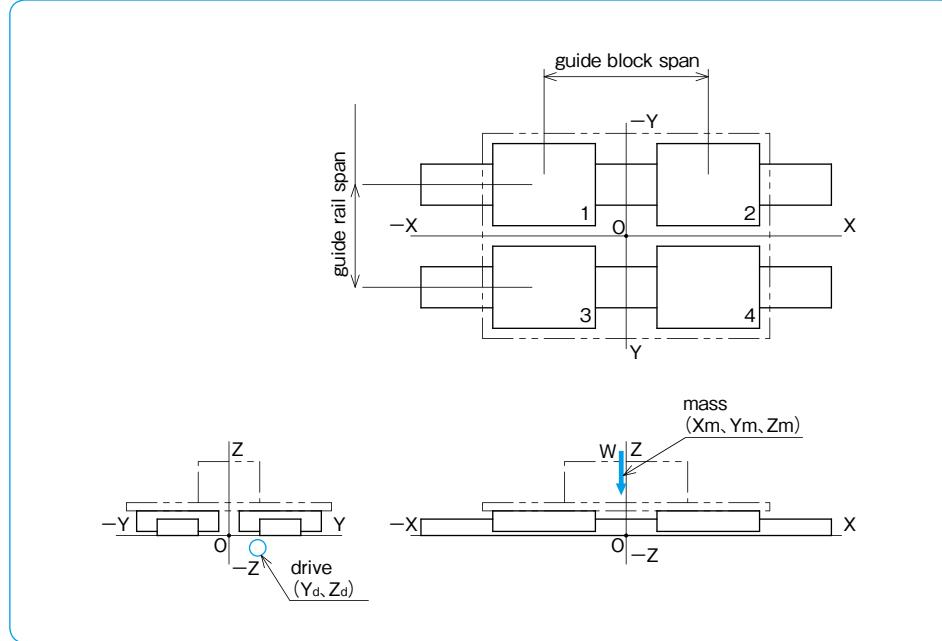

Figure 1-11

## ① Calculating Moment Applied to the Unit

**(acceleration)**

pitching  $M_{a1}=m \cdot g \cdot X_m - m \cdot a_1 \cdot (Z_m - Z_d)$

$$M_{a1}=30 \times 9.8 \times (15) - 30 \times 1 \times \{(20) - (-10)\} + 15 \times 9.8 \times (80) - 15 \times 1 \times \{(100) - (-10)\} = 13620 \text{ N} \cdot \text{mm}$$

yawing  $M_{a2}=-m \cdot a_1 \cdot (Y_m - Y_d)$

$$M_{a2}=-30 \times 1 \times \{(-20) - (-10)\} - 15 \times 1 \times \{(50) - (10)\} = 300 \text{ N} \cdot \text{mm}$$

rolling  $M_{a3}=m \cdot g \cdot Y_m$

$$M_{a3}=30 \times 9.8 \times (-20) + 15 \times 9.8 \times (50) = 1470 \text{ N} \cdot \text{mm}$$

**(constant)**

pitching  $M_1=m \cdot g \cdot X_m$

$$M_1=30 \times 9.8 \times (15) + 15 \times 9.8 \times (80) = 16170 \text{ N} \cdot \text{mm}$$

yawing  $M_2=0$

rolling  $M_3=m \cdot g \cdot Y_m$

$$M_3=30 \times 9.8 \times (-20) + 15 \times 9.8 \times (50) = 1470 \text{ N} \cdot \text{mm}$$

**(deceleration)**

pitching  $M_{d1}=m \cdot g \cdot X_m + m \cdot a_3 \cdot (Z_m - Z_d)$

$$M_{d1}=30 \times 9.8 \times (15) + 30 \times 1 \times \{(20) - (-10)\} + 15 \times 9.8 \times (80) + 15 \times 1 \times \{(100) - (-10)\} = 18720 \text{ N} \cdot \text{mm}$$

yawing  $M_{d2}=m \cdot a_3 \cdot (Y_m - Y_d)$

$$M_{d2}=30 \times 1 \times \{(-20) - (-10)\} + 15 \times 1 \times \{(50) - (10)\} = -300 \text{ N} \cdot \text{mm}$$

rolling  $M_{d3}=m \cdot g \cdot Y_m$

$$M_{d3}=30 \times 9.8 \times (-20) + 15 \times 9.8 \times (50) = 1470 \text{ N} \cdot \text{mm}$$

## ② Calculating Load Applied to the Guide Block

**(acceleration)**

Block 1 vertical direction  $F_{ra1}=\frac{m \cdot g}{4} - \frac{M_{a1}}{2 \cdot L_{unit}} + \frac{M_{a3}}{2 \cdot L_{rail}}$

$$F_{ra1}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{13620}{2 \times 100} + \frac{1470}{2 \times 100} = 49.5 \text{ N}$$

horizontal direction  $F_{sa1}=\frac{M_{a2}}{2 \cdot L_{unit}}$

$$F_{sa1}=\frac{300}{2 \times 100} = 1.5 \text{ N}$$

Block 2 vertical direction  $F_{ra2}=\frac{m \cdot g}{4} + \frac{M_{a1}}{2 \cdot L_{unit}} + \frac{M_{a3}}{2 \cdot L_{rail}}$

$$F_{ra2}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{13620}{2 \times 100} + \frac{1470}{2 \times 100} = 185.7 \text{ N}$$

horizontal direction  $F_{sa2}=-\frac{M_{a2}}{2 \cdot L_{unit}}$

$$F_{sa2}=-\frac{300}{2 \times 100} = -1.5 \text{ N}$$

Block 3

vertical direction  $F_{ra3}=\frac{m \cdot g}{4} - \frac{M_{a1}}{2 \cdot L_{unit}} - \frac{M_{a3}}{2 \cdot L_{rail}}$

$$F_{ra3}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{13620}{2 \times 100} - \frac{1470}{2 \times 100} = 34.8 \text{ N}$$

horizontal direction  $F_{sa3}=\frac{M_{a2}}{2 \cdot L_{unit}}$

$$F_{sa3}=\frac{300}{2 \times 100} = 1.5 \text{ N}$$

Block 4

vertical direction  $F_{ra4}=\frac{m \cdot g}{4} + \frac{M_{a1}}{2 \cdot L_{unit}} - \frac{M_{a3}}{2 \cdot L_{rail}}$

$$F_{ra4}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{13620}{2 \times 100} - \frac{1470}{2 \times 100} = 171.0 \text{ N}$$

horizontal direction  $F_{sa4}=-\frac{M_{a2}}{2 \cdot L_{unit}}$

$$F_{sa4}=-\frac{300}{2 \times 100} = -1.5 \text{ N}$$

(constant)

Block 1

vertical direction  $F_{r1}=\frac{m \cdot g}{4} - \frac{M_1}{2 \cdot L_{unit}} + \frac{M_3}{2 \cdot L_{rail}}$

$$F_{r1}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{16170}{2 \times 100} + \frac{1470}{2 \times 100} = 36.8 \text{ N}$$

horizontal direction  $F_{s1}=\frac{M_2}{2 \cdot L_{unit}}$

Block 2

vertical direction  $F_{r2}=\frac{m \cdot g}{4} + \frac{M_1}{2 \cdot L_{unit}} + \frac{M_3}{2 \cdot L_{rail}}$

$$F_{r2}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{16170}{2 \times 100} + \frac{1470}{2 \times 100} = 198.5 \text{ N}$$

horizontal direction  $F_{s2}=-\frac{M_2}{2 \cdot L_{unit}}$

Block 3

vertical direction  $F_{r3}=\frac{m \cdot g}{4} - \frac{M_1}{2 \cdot L_{unit}} - \frac{M_3}{2 \cdot L_{rail}}$

$$F_{r3}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{16170}{2 \times 100} - \frac{1470}{2 \times 100} = 22.1 \text{ N}$$

horizontal direction  $F_{s3}=\frac{M_2}{2 \cdot L_{unit}}$

Block 4

vertical direction  $F_{r4}=\frac{m \cdot g}{4} + \frac{M_1}{2 \cdot L_{unit}} - \frac{M_3}{2 \cdot L_{rail}}$

$$F_{r4}=\frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{16170}{2 \times 100} - \frac{1470}{2 \times 100} = 183.8 \text{ N}$$

horizontal direction  $F_{s4}=-\frac{M_2}{2 \cdot L_{unit}}$

(deceleration)

Block 1 vertical direction  $F_{rd1} = \frac{m \cdot g}{4} - \frac{Md_1}{2 \cdot L_{unit}} + \frac{Md_3}{2 \cdot L_{rail}}$

$$F_{rd1} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{18720}{2 \times 100} + \frac{1470}{2 \times 100} = 24.0N$$

horizontal direction  $F_{sd1} = \frac{Md_2}{2 \cdot L_{unit}}$

$$F_{sd1} = \frac{-300}{2 \times 100} = -1.5N$$

Block 2 vertical direction  $F_{rd2} = \frac{m \cdot g}{4} + \frac{Md_1}{2 \cdot L_{unit}} + \frac{Md_3}{2 \cdot L_{rail}}$

$$F_{rd2} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{18720}{2 \times 100} + \frac{1470}{2 \times 100} = 211.2N$$

horizontal direction  $F_{sd2} = -\frac{Md_2}{2 \cdot L_{unit}}$

$$F_{sd2} = -\frac{-300}{2 \times 100} = 1.5N$$

Block 3 vertical direction  $F_{rd3} = \frac{m \cdot g}{4} - \frac{Md_1}{2 \cdot L_{unit}} - \frac{Md_3}{2 \cdot L_{rail}}$

$$F_{rd3} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} - \frac{18720}{2 \times 100} - \frac{1470}{2 \times 100} = 9.3N$$

horizontal direction  $F_{sd3} = \frac{Md_2}{2 \cdot L_{unit}}$

$$F_{sd3} = \frac{300}{2 \times 100} = -1.5N$$

Block 4 vertical direction  $F_{rd4} = \frac{m \cdot g}{4} + \frac{Md_1}{2 \cdot L_{unit}} - \frac{Md_3}{2 \cdot L_{rail}}$

$$F_{rd4} = \frac{30 \times 9.8}{4} + \frac{15 \times 9.8}{4} + \frac{18720}{2 \times 100} - \frac{1470}{2 \times 100} = 196.5N$$

horizontal direction  $F_{sd4} = -\frac{Md_2}{2 \cdot L_{unit}}$

$$F_{sd4} = -\frac{-300}{2 \times 100} = 1.5N$$

### ③ Calculating Equivalent Load

• Pr in the vertical direction and Ps in the horizontal direction are calculated by the following equations.

$$Pr = |F_r|$$

$$Ps = |k \cdot F_s|$$

$k=1$  for SGL guide

Table 1-26

	acceleration	constant	deceleration
block 1	$P_{ra1}=49.5$	$P_{r1}=36.8$	$P_{rd1}=24.0$
	$P_{sa1}=1.5$	$P_{s1}=0$	$P_{sd1}=1.5$
block 2	$P_{ra2}=185.7$	$P_{r2}=198.5$	$P_{rd2}=211.2$
	$P_{sa2}=1.5$	$P_{s2}=0$	$P_{sd2}=1.5$
block 3	$P_{ra3}=34.8$	$P_{r3}=22.1$	$P_{rd3}=9.3$
	$P_{sa3}=1.5$	$P_{s3}=0$	$P_{sd3}=1.5$
block 4	$P_{ra4}=171.0$	$P_{r4}=183.8$	$P_{rd4}=196.5$
	$P_{sa4}=1.5$	$P_{s4}=0$	$P_{sd4}=1.5$

◎ Equation for Dynamic Equivalent Load

$$P = Pr + Ps$$

$$P_{a1}=P_{ra1}+P_{sa1}=49.5+1.5=51.0 \text{ (N)}$$

calculating in the same manner

Table 1-27

	acceleration	constant	deceleration
block 1	$P_{a1}=51.0$	$P_1=36.8$	$P_{d1}=25.5$
block 2	$P_{a2}=187.2$	$P_2=198.5$	$P_{d2}=212.7$
block 3	$P_{a3}=36.3$	$P_3=22.1$	$P_{d3}=10.8$
block 4	$P_{a4}=172.5$	$P_4=183.8$	$P_{d4}=198.0$

◎ Calculating Average Equivalent Load

$$P_m = \sqrt[3]{\frac{1}{L_s} \times \left\{ (P_{a1}^3 \times \frac{V_{max} \times t_1}{2}) + (P_{a2}^3 \times V_{max} \times t_2) + (P_{a3}^3 \times \frac{V_{max} \times t_3}{2}) \right\}}$$

$$P_{m1} = \sqrt[3]{\frac{1}{700} \times \left\{ (51.0^3 \times \frac{200 \times 0.2}{2}) + (36.8^3 \times 200 \times 3.3) + (25.5^3 \times \frac{200 \times 0.2}{2}) \right\}} = 37.1(N)$$

$$P_{m2} = \sqrt[3]{\frac{1}{700} \times \left\{ (187.2^3 \times \frac{200 \times 0.2}{2}) + (198.5^3 \times 200 \times 3.3) + (212.7^3 \times \frac{200 \times 0.2}{2}) \right\}} = 198.6(N)$$

$$P_{m3} = \sqrt[3]{\frac{1}{700} \times \left\{ (36.3^3 \times \frac{200 \times 0.2}{2}) + (22.1^3 \times 200 \times 3.3) + (10.8^3 \times \frac{200 \times 0.2}{2}) \right\}} = 22.6(N)$$

$$P_{m4} = \sqrt[3]{\frac{1}{700} \times \left\{ (172.5^3 \times \frac{200 \times 0.2}{2}) + (183.8^3 \times 200 \times 3.3) + (198.0^3 \times \frac{200 \times 0.2}{2}) \right\}} = 183.9(N)$$

### ④ Calculating Rated Life

Decide each coefficient

• hardness coefficient  $f_H=1$  for hardness of guide is 58HRC or more

• temperature coefficient  $f_T=1$  operating temperature is below 100°C (80°C is maximum for SGL guide)

• contact coefficient  $f_C=1$  for blocks are not in close contact

• applied load coefficient  $f_W=1.5$  for  $V_{max}=200\text{mm/s}$

◎ Calculating Rated Life

Selecting Block 2 that carries the maximum dynamic equivalent load

$$L = \left( \frac{f_H \times f_T \times f_C}{f_W} \times \frac{C}{P_m} \right)^3 \times 50$$

$$L = \left( \frac{1 \times 1 \times 1}{1.5} \times \frac{7290}{198.6} \right)^3 \times 50 = 732725(\text{km})$$

◎ Calculating Life Time

$$L_h = \frac{L \times 10^3}{2 \times \ell_s \times n_1 \times 60}$$

$$L_h = \frac{732725 \times 10^3}{2 \times 0.7 \times 8 \times 60} = 1090364(\text{hour})$$

## ⑤ Calculating Static Safety Factor

○ Equation for Static Equivalent Load

$$P_o = P_r + P_s$$

$$P_{o1} = P_{r1} + P_{s1} = 49.5 + 1.5 = 51.0 \text{ (N)}$$

calculating in the same manner

Table 1-28

	acceleration	constant	deceleration
block 1	P <sub>o1</sub> =51.0	P <sub>o1</sub> =36.8	P <sub>od1</sub> =25.5
block 2	P <sub>o2</sub> =187.2	P <sub>o2</sub> =198.5	P <sub>od2</sub> =212.7
block 3	P <sub>o3</sub> =36.3	P <sub>o3</sub> =22.1	P <sub>od3</sub> =10.8
block 4	P <sub>o4</sub> =172.5	P <sub>o4</sub> =183.8	P <sub>od4</sub> =198.0

Selecting Block 2 that carries the maximum static equivalent load

$$f_s = \frac{C_0}{P_o}$$

$$f_s = \frac{C_0}{P_{o1}} = \frac{9450}{212.7} = 44$$

## RATED LIFE CALCULATION EXAMPLE 2

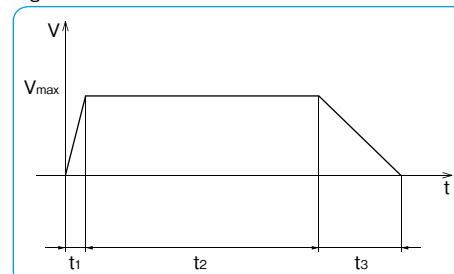

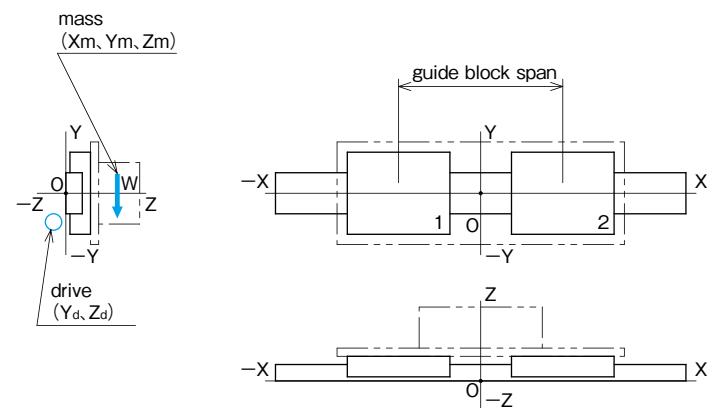

Figure 1-13

## ① Calculating Moment Applied to the Unit

**(acceleration)**

pitching  $M_{a1}=m \cdot g \cdot X_m - m \cdot a_1 \cdot (Z_m - Z_d)$

$$M_{a1}=5 \times 9.8 \times (0) - 5 \times 1.5 \times \{(10) - (-10)\} + 20 \times 9.8 \times (-20) - 20 \times 1.5 \times \{(20) - (-10)\} = -4970 \text{ N} \cdot \text{mm}$$

yawing  $M_{a2}=-m \cdot a_1 \cdot (Y_m - Y_d)$

$$M_{a2}=-5 \times 1.5 \times \{(0) - (-30)\} - 20 \times 1.5 \times \{(-10) - (-30)\} = -825 \text{ N} \cdot \text{mm}$$

rolling  $M_{a3}=m \cdot g \cdot Y_m$

$$M_{a3}=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-10) = -1960 \text{ N} \cdot \text{mm}$$

**(constant)**

pitching  $M_1=m \cdot g \cdot X_m$

$$M_1=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-20) = -3920 \text{ N} \cdot \text{mm}$$

yawing  $M_2=0$

$$M_2=0 \text{ N} \cdot \text{mm}$$

rolling  $M_3=m \cdot g \cdot Y_m$

$$M_3=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-10) = -1960 \text{ N} \cdot \text{mm}$$

**(deceleration)**

pitching  $M_{d1}=m \cdot g \cdot X_m + m \cdot a_3 \cdot (Z_m - Z_d)$

$$M_{d1}=5 \times 9.8 \times (0) + 5 \times 1.5 \times \{(10) - (-10)\} + 20 \times 9.8 \times (-20) + 20 \times 1.5 \times \{(20) - (-10)\} = -2870 \text{ N} \cdot \text{mm}$$

yawing  $M_{d2}=m \cdot a_3 \cdot (Y_m - Y_d)$

$$M_{d2}=5 \times 1.5 \times \{(0) - (-30)\} + 20 \times 1.5 \times \{(-10) - (-30)\} = 825 \text{ N} \cdot \text{mm}$$

rolling  $M_{d3}=m \cdot g \cdot Y_m$

$$M_{d3}=5 \times 9.8 \times (0) + 20 \times 9.8 \times (-10) = -1960 \text{ N} \cdot \text{mm}$$

## ② Calculating Load Applied to the Guide Block

**(acceleration)**

Block 1 vertical direction  $F_{ra1}=\frac{m \cdot g}{2} - \frac{M_{a1}}{L_{unit}}$

$$F_{ra1}=\frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} - \frac{-4970}{70} = 193.5 \text{ N}$$

horizontal direction  $F_{sa1}=\frac{M_{a2}}{L_{unit}}$

$$F_{sa1}=\frac{-825}{70} = -11.8 \text{ N}$$

rolling moment  $M_{ra1}=\frac{M_{a3}}{2}$

$$M_{ra1}=\frac{-1960}{2} = -980 \text{ N} \cdot \text{mm}$$

Block 2 vertical direction  $F_{ra2}=\frac{m \cdot g}{2} + \frac{M_{a1}}{L_{unit}}$

$$F_{ra2}=\frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} + \frac{-4970}{70} = 51.5 \text{ N}$$

horizontal direction  $F_{sa2}=\frac{M_{a2}}{L_{unit}}$

$$F_{sa2}=\frac{-825}{70} = -11.8 \text{ N}$$

rolling moment  $M_{ra2}=\frac{M_{a3}}{2}$

$$M_{ra2}=\frac{-1960}{2} = -980 \text{ N} \cdot \text{mm}$$

**(constant)**

Block 1 vertical direction  $F_{r1}=\frac{m \cdot g}{2} - \frac{M_1}{L_{unit}}$

$$F_{r1}=\frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} - \frac{-3920}{70} = 178.5 \text{ N}$$

horizontal direction  $F_{s1}=\frac{M_2}{L_{unit}}$

rolling moment  $M_{r1}=\frac{M_3}{2}$

$$M_{r1}=\frac{-1960}{2} = -980 \text{ N} \cdot \text{mm}$$

Block 2 vertical direction  $F_{r2}=\frac{m \cdot g}{2} + \frac{M_1}{L_{unit}}$

$$F_{r2}=\frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} + \frac{-3920}{70} = 66.5 \text{ N}$$

horizontal direction  $F_{s2}=-\frac{M_2}{L_{unit}}$

rolling moment  $M_{r2}=\frac{M_3}{2}$

$$M_{r2}=\frac{-1960}{2} = -980 \text{ N} \cdot \text{mm}$$

(deceleration)

Block 1

vertical direction  $F_{rd1} = \frac{m \cdot g}{2} - \frac{Md_1}{L_{unit}}$

$$F_{rd1} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} - \frac{-2870}{70} = 163.5N$$

horizontal direction  $F_{sd1} = \frac{Md_2}{L_{unit}}$

$$F_{sd1} = \frac{825}{70} = 11.8N$$

rolling moment  $M_{rd1} = \frac{Md_3}{2}$

$$M_{rd1} = \frac{-1960}{2} = -980N \cdot mm$$

Block 2

vertical direction  $F_{rd2} = \frac{m \cdot g}{2} + \frac{Md_1}{L_{unit}}$

$$F_{rd2} = \frac{5 \times 9.8}{2} + \frac{20 \times 9.8}{2} + \frac{-2870}{70} = 81.5N$$

horizontal direction  $F_{sd2} = -\frac{Md_2}{L_{unit}}$

$$F_{sd2} = -\frac{825}{70} = -11.8N$$

rolling moment  $M_{rd2} = \frac{Md_3}{2}$

$$M_{rd2} = \frac{-1960}{2} = -980N \cdot mm$$

### ③ Calculating Equivalent Load

◎  $P_r$  in the vertical direction and  $P_s$  in the horizontal direction are calculated by the following equations.

$$P_r = |F_r| + |E_r \cdot M_r|$$

$$P_s = |k \cdot F_s|$$

$$E_r = 0.220 \text{ for SEB9A}$$

$$k = 0.84 \text{ for SEB-A guide}$$

$$P_{ra1} = |F_{ra1}| + |E_r \cdot M_{ra1}| = |193.5| + |0.220 \times (-980)| = 409.1(N)$$

calculating in the same manner

Table 1-29

	acceleration	constant	deceleration
block 1	$P_{ra1} = 409.1$	$P_{r1} = 394.1$	$P_{d1} = 379.1$
	$P_{sa1} = 9.9$	$P_{s1} = 0$	$P_{sd1} = 9.9$
block 2	$P_{ra2} = 267.1$	$P_{r2} = 282.1$	$P_{d2} = 297.1$
	$P_{sa2} = 9.9$	$P_{s2} = 0$	$P_{sd2} = 9.9$

◎ Equation for Dynamic Equivalent Load

$$P = P_r + P_s$$

$$P_{a1} = P_{ra1} + P_{sa1} = 409.1 + 9.9 = 419.0(N)$$

calculating in the same manner

Table 1-30

	acceleration	constant	deceleration
block 1	$P_{a1} = 419.0$	$P_1 = 394.1$	$P_{d1} = 389.0$
block 2	$P_{a2} = 277.0$	$P_2 = 282.1$	$P_{d2} = 307.0$

◎ Calculating Average Equivalent Load

$$P_m = \sqrt[3]{\frac{1}{L_s} \times \left\{ (P_a^3 \times \frac{V_{max} \times t_1}{2}) + (P^3 \times V_{max} \times t_2) + (P_d^3 \times \frac{V_{max} \times t_3}{2}) \right\}}$$

$$P_{m1} = \sqrt[3]{\frac{1}{300} \times \left\{ (419.0^3 \times \frac{150 \times 0.1}{2}) + (394.1^3 \times 150 \times 1.9) + (389.0^3 \times \frac{150 \times 0.1}{2}) \right\}} = 394.6(N)$$

$$P_{m2} = \sqrt[3]{\frac{1}{300} \times \left\{ (277.0^3 \times \frac{150 \times 0.1}{2}) + (282.1^3 \times 150 \times 1.9) + (307.0^3 \times \frac{150 \times 0.1}{2}) \right\}} = 282.7(N)$$

#### ④ Calculating Rated Life

Decide each coefficient

- hardness coefficient  $f_H=1$  for hardness of guide is 58HRC or more
- temperature coefficient  $f_T=1$  operating temperature is below 100°C (80°C is maximum for SEB-A guide)
- contact coefficient  $f_C=1$  for blocks are not in close contact
- applied load coefficient  $f_W=1.5$  for  $V_{max}=150\text{mm/s}$

##### ◎ Calculating Rated Life

Selecting Block 1 that carries the maximum dynamic equivalent load

$$L = \left( \frac{f_H \times f_T \times f_C}{f_W} \times \frac{C}{P_m} \right)^3 \times 50$$

$$L = \left( \frac{1 \times 1 \times 1}{1.5} \times \frac{1920}{394.6} \right)^3 \times 50 = 1706(\text{km})$$

##### ◎ Calculating Life Time

$$L_h = \frac{L \times 10^3}{2 \times l_s \times n_1 \times 60}$$

$$L_h = \frac{1706 \times 10^3}{2 \times 0.3 \times 14 \times 60} = 3384(\text{hour})$$

#### ⑤ Calculating Static Safety Factor

##### ◎ Equation for Static Equivalent Load

$$P_o = P_r + P_s$$

$$P_{o1} = P_{r1} + P_{s1} = 409.1 + 9.9 = 419.0 (\text{N})$$

calculating in the same manner

Table 1-31

	acceleration	constant	deceleration
block 1	$P_{o1} = 419.0$	$P_{o1} = 394.1$	$P_{o1} = 389.0$
block 2	$P_{o2} = 277.0$	$P_{o2} = 282.1$	$P_{o2} = 307.0$

##### Selecting Block 1 that carries the maximum static equivalent load

$$f_s = \frac{C_o}{P_o}$$

$$f_s = \frac{C_o}{P_{o1}} = \frac{2530}{419.0} = 6.0$$

## ① Calculating Moment Applied to the Unit

⟨acceleration⟩

pitching  $M_{a1}=m \cdot g \cdot (Z_m - Z_d) + m \cdot a_1 \cdot (Z_m - Z_d)$

$$M_{a1}=5 \times 9.8 \times \{(30) - (-20)\} + 5 \times 1.5 \times \{(30) - (-20)\} + 20 \times 9.8 \times \{(20) - (-20)\} + 20 \times 1.5 \times \{(20) - (-20)\} = 11865 \text{ N} \cdot \text{mm}$$

yawing  $M_{a2}=m \cdot g \cdot (Y_m - Y_d) + m \cdot a_1 \cdot (Y_m - Y_d)$

$$M_{a2}=5 \times 9.8 \times \{(0) - (20)\} + 5 \times 1.5 \times \{(0) - (20)\} + 20 \times 9.8 \times \{(50) - (20)\} + 20 \times 1.5 \times \{(50) - (20)\} = 5650 \text{ N} \cdot \text{mm}$$

rolling  $M_{a3}=0$

⟨constant⟩

pitching  $M_1=m \cdot g \cdot (Z_m - Z_d)$

$$M_1=5 \times 9.8 \times \{(30) - (-20)\} + 20 \times 9.8 \times \{(20) - (-20)\} = 10290 \text{ N} \cdot \text{mm}$$

yawing  $M_2=m \cdot g \cdot (Y_m - Y_d)$

$$M_2=5 \times 9.8 \times \{(0) - (20)\} + 20 \times 9.8 \times \{(50) - (20)\} = 4900 \text{ N} \cdot \text{mm}$$

rolling  $M_3=0$

⟨deceleration⟩

pitching  $M_{d1}=m \cdot g \cdot (Z_m - Z_d) - m \cdot a_3 \cdot (Z_m - Z_d)$

$$M_{d1}=5 \times 9.8 \times \{(30) - (-20)\} - 5 \times 1.5 \times \{(30) - (-20)\} + 20 \times 9.8 \times \{(20) - (-20)\} - 20 \times 1.5 \times \{(20) - (-20)\} = 8715 \text{ N} \cdot \text{mm}$$

yawing  $M_{d2}=m \cdot g \cdot (Y_m - Y_d) - m \cdot a_3 \cdot (Y_m - Y_d)$

$$M_{d2}=5 \times 9.8 \times \{(0) - (20)\} - 5 \times 1.5 \times \{(0) - (20)\} + 20 \times 9.8 \times \{(50) - (20)\} - 20 \times 1.5 \times \{(50) - (20)\} = 4150 \text{ N} \cdot \text{mm}$$

rolling  $M_{d3}=0$

## ② Calculating Load Applied to the Slide Bush

⟨acceleration⟩

Bush 1 vertical direction  $F_{ra1}=\frac{M_{a3}}{L_{rail}}=0$

horizontal direction  $F_{sa1}=0$

pitching  $M_{pa1}=\frac{M_{a1}}{2}$

$$M_{pa1}=\frac{11865}{2}=5932.5 \text{ N} \cdot \text{mm}$$

yawing  $M_{ya1}=\frac{M_{a2}}{2}$

$$M_{ya1}=\frac{5650}{2}=2825 \text{ N} \cdot \text{mm}$$

Bush 2

vertical direction  $F_{ra2}=\frac{M_{a3}}{2 \cdot L_{rail}}=0$

horizontal direction  $F_{sa2}=0$

pitching  $M_{pa2}=\frac{M_{a1}}{2}$

$$M_{pa2}=\frac{11865}{2}=5932.5 \text{ N} \cdot \text{mm}$$

yawing  $M_{ya2}=\frac{M_{a2}}{2}$

$$M_{ya2}=\frac{5650}{2}=2825 \text{ N} \cdot \text{mm}$$

⟨constant⟩

Bush 1 vertical direction  $F_{r1}=\frac{M_3}{L_{rail}}=0$

horizontal direction  $F_{s1}=0$

pitching  $M_{p1}=\frac{M_1}{2}$

$$M_{p1}=\frac{10290}{2}=5145 \text{ N} \cdot \text{mm}$$

yawing  $M_{y1}=\frac{M_2}{2}$

$$M_{y1}=\frac{4900}{2}=2450 \text{ N} \cdot \text{mm}$$

Bush 2

vertical direction  $F_{r2}=\frac{M_3}{L_{rail}}=0$

horizontal direction  $F_{s2}=0$

pitching  $M_{p2}=\frac{M_1}{2}$

$$M_{p2}=\frac{10290}{2}=5145 \text{ N} \cdot \text{mm}$$

yawing  $M_{y2}=\frac{M_2}{2}$

$$M_{y2}=\frac{4900}{2}=2450 \text{ N} \cdot \text{mm}$$

(deceleration)

Bush 1

vertical direction  $F_{rd1} = \frac{Md_3}{L_{rail}} = 0$

horizontal direction  $F_{sd1} = 0$

pitching  $M_{pd1} = \frac{Md_1}{2}$

$M_{pd1} = \frac{8715}{2} = 4357.5 \text{ N} \cdot \text{mm}$

yawing  $M_{yd1} = \frac{Md_2}{2}$

$M_{yd1} = \frac{4150}{2} = 2075 \text{ N} \cdot \text{mm}$

Bush 2

vertical direction  $F_{rd2} = \frac{Md_3}{L_{rail}} = 0$

horizontal direction  $F_{sd2} = 0$

pitching  $M_{pd2} = \frac{Md_1}{2}$

$M_{pd2} = \frac{8715}{2} = 4357.5 \text{ N} \cdot \text{mm}$

yawing  $M_{yd2} = \frac{Md_2}{2}$

$M_{yd2} = \frac{4150}{2} = 2075 \text{ N} \cdot \text{mm}$

### ③ Calculating Equivalent Load

◎  $P_r$  in the vertical direction and  $P_s$  in the horizontal direction are calculated by the following equations.

$$P_r = |F_r| + |E_1 \cdot M_p|$$

$$P_s = |k \cdot F_s| + |E_1 \cdot M_y|$$

$$E_1 = 6.63 \times 10^{-2} \text{ for SM30W}$$

$$k=1 \text{ for Slide Bush}$$

Table 1-32

	acceleration	constant	deceleration
bush 1	$P_{ra1} = 393.3$	$P_{r1} = 341.1$	$P_{rd1} = 288.9$
	$P_{sa1} = 187.3$	$P_{s1} = 162.4$	$P_{sd1} = 137.6$
bush 2	$P_{ra2} = 393.3$	$P_{r2} = 341.1$	$P_{rd2} = 288.9$
	$P_{sa2} = 187.3$	$P_{s2} = 162.4$	$P_{sd2} = 137.6$

◎ Equation for Dynamic Equivalent Load

$$P = P_r + P_s$$

$$P_{a1} = P_{ra1} + P_{sa1} = 393.3 + 187.3 = 580.6(\text{N})$$

calculating in the same manner

Table 1-33

	acceleration	constant	deceleration
bush 1	$P_{a1} = 580.6$	$P_1 = 503.5$	$P_{d1} = 426.5$
bush 2	$P_{a2} = 580.6$	$P_2 = 503.5$	$P_{d2} = 426.5$

◎ Calculating Average Equivalent Load

$$P_m = \sqrt[3]{\frac{1}{L_s} \times \left\{ (P_a^3 \times \frac{V_{max} \times t_1}{2}) + (P^3 \times V_{max} \times t_2) + (P_d^3 \times \frac{V_{max} \times t_3}{2}) \right\}}$$

$$P_{m1} = \sqrt[3]{\frac{1}{120} \times \left\{ (580.6^3 \times \frac{150 \times 0.1}{2}) + (503.5^3 \times 150 \times 0.7) + (426.5^3 \times \frac{150 \times 0.1}{2}) \right\}} = 505.0(\text{N})$$

$$P_{m2} = \sqrt[3]{\frac{1}{120} \times \left\{ (580.6^3 \times \frac{150 \times 0.1}{2}) + (503.5^3 \times 150 \times 0.7) + (426.5^3 \times \frac{150 \times 0.1}{2}) \right\}} = 505.0(\text{N})$$

#### ④ Calculating Rated Life

Decide each coefficient

- hardness coefficient  $f_H=1$  for hardness of bush is 58HRC or more
- temperature coefficient  $f_T=1$  operating temperature is below 100°C (80°C is maximum for Bush with resin retainer)
- contact coefficient  $f_C=1$  for bushes are not in close contact
- applied load coefficient  $f_W=1.5$  for  $V_{max}=150\text{mm/s}$

##### ◎ Calculating Rated Life

Selecting Bush 1 that carries the maximum equivalent load

$$L = \left( \frac{f_H \times f_T \times f_C}{f_W} \times \frac{C}{P_m} \right)^3 \times 50$$

$$L = \left( \frac{1 \times 1 \times 1}{1.5} \times \frac{2490}{505.0} \right)^3 \times 50 = 1775(\text{km})$$

##### ◎ Calculating Life Time

$$L_h = \frac{L \times 10^3}{2 \times l_s \times n_i \times 60}$$

$$L_h = \frac{1775 \times 10^3}{2 \times 0.120 \times 33 \times 60} = 3735(\text{hour})$$

#### ⑤ Calculating Static Safety Factor

◎ Equation for Static Equivalent Load

$$P_o = P_r + P_s$$

$$P_{o1} = P_{r1} + P_{s1} = 393.3 + 187.3 = 580.6(\text{N})$$

calculating in the same manner

Table 1-34

	acceleration	constant	deceleration
bush 1	$P_{o1} = 580.6$	$P_{o1} = 503.5$	$P_{o1} = 426.5$
bush 2	$P_{o2} = 580.6$	$P_{o2} = 503.5$	$P_{o2} = 426.5$

Selecting Bush 1 that carries the maximum static equivalent load

$$f_s = \frac{C_o}{P_o}$$

$$f_s = \frac{C_o}{P_{o1}} = \frac{5490}{580.6} = 9.4$$

## RIGIDITY AND PRELOAD

#### Effect of Preload and Rigidity

The rigidity of a linear system must be taken into consideration when it is to be used in high-precision positioning devices or high-precision machinery. Preloaded slide guides and ball splines, which use balls as the rolling elements, are available upon request to meet the need for greater rigidity.

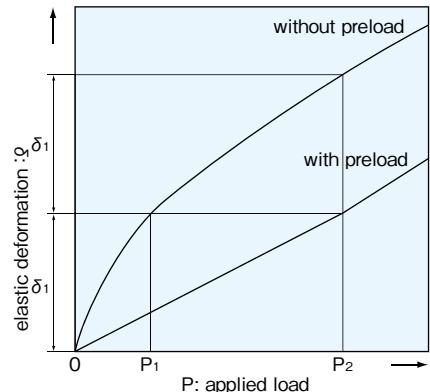

If a force is applied to the ball elements without preload, an elastic deformation proportional to the applied force to the 2/3 power will result. Therefore, the elastic deformation is relatively large during the initial loading stage, however then becomes smaller as the load increases.

Preloading on the rolling elements absorbs the deformation of the block under the same loading. Please contact NB for available data in regard to rigidity.

#### Types of Preload and its Specification

Preload is categorized into three ranges: standard, light, and medium for option. In the NB linear system, preload is applied by installing rolling elements that are slightly larger than standard. Therefore, the specification of the preload is expressed by a negative value.

Figure 1-16 Applied Load versus Block Deformation

## FRictional RESISTANCE AND REQUIRED THRUST

The static friction of a linear system is extremely low. Since the difference between the static and dynamic friction is marginal, stable motion can be achieved from low to high speed. The frictional resistance (required thrust) can be obtained from the load and the seal resistance unique to each type of system using the following equation:

$$F = \mu \cdot W + f \quad \dots \dots \dots \quad (14)$$

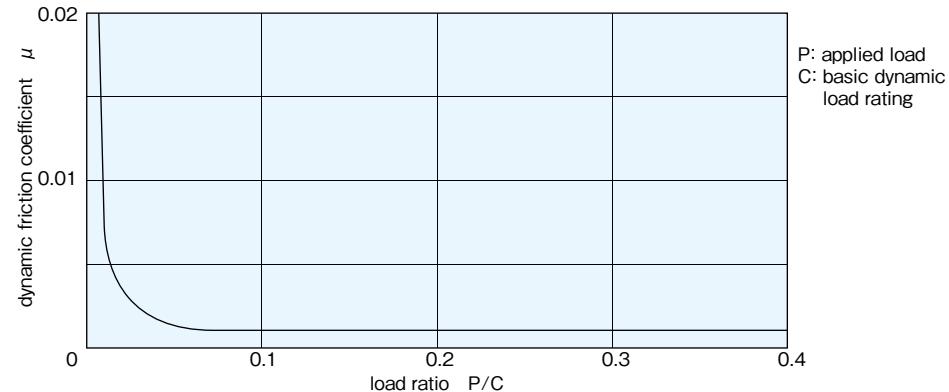

F: frictional resistance (N)     $\mu$ : dynamic friction coefficient  
W: applied load (N)    f: seal resistance (N)

The dynamic friction coefficient varies with the applied load, preload, viscosity of the lubricant, and other factors. However, the values given in Table 1-35 are used for the normal loading condition (20% of basic dynamic load rating) without any preload. The seal resistance depends on the seal-lip condition as well as on the condition of the lubricant, however, it does not change proportionally with the applied load, which commonly is expressed by a constant value of 2 to 5 N.

Table 1-35 Dynamic Friction Coefficient

product	type	dynamic friction coefficient ( $\mu$ )

## OPERATING ENVIRONMENT

### Temperature Range

The NB linear systems are heat-treated in order to harden the surface. Therefore, if the temperature of the linear system exceeds 100°C, the hardness and load rating will be reduced (refer to page Eng-5, hardness coefficient). If resin is used in any one of the components, the system cannot be used in a high-temperature environment. The recommended operating temperature ranges for each type of linear system are listed in Table 1-36.

Table 1-36 Major Types and Recommended Temperature Range

component material	includes resin	steel	stainless	other
operating temperature range	-20°C~80°C	-20°C~110°C	-20°C~140°C*

\* If the system is made of stainless steel and has a seal, the temperature range is up to 120°C

\*\* Please contact NB if the system is to be used out of room temperatures.

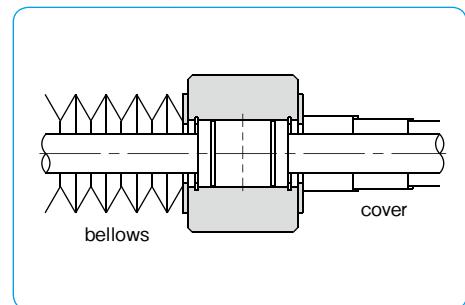

Temperature Conversion Equation:

$$C = \frac{5}{9}(F - 32) \quad F = \frac{9}{5}C + 32$$

### Operating Environment

Foreign particles or dust in the linear system affects the motion accuracy and shortens the life time. Standard seals will perform well for dust prevention under normal operating conditions, however, in a harsh environment it is necessary to attach bellows or protective covers as Figure 1-18 shows.

Figure 1-18 Example of Dust Prevention

## LUBRICATION

The objective of lubrication includes the reduction of friction among the rolling elements as well as between the rolling elements and the raceway, prevention of sintering, reduction of wear, and the prevention of rust by forming a film over the surfaces. To maximize the performance of a linear system, the lubricant type and a lubrication method appropriate for the operating environment should be selected.

There are two types of lubrication; oil lubrication and grease lubrication. For oil lubrication, turbine oil conforming to ISO standard VG32 to 68 is recommended.

For grease lubrication, lithium soap based grease No.2 is recommended. For slide bush and some other products, anti-rust oil that does not adversely affect the lubricant is applied prior to shipment. Please apply lubricant before using these products. (see Table 1-37) Products with raceway grooves, such as slide guide, are delivered pre-lubricated with grease for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions. The recommended relubrication period is about 6 months or 1,000km of travel distance under normal conditions.

Table 1-37 Grease and Anti-rust oil

type	grease application
Slide Guide	grease pre-applied

Slide Table	grease pre-applied
Miniature Slide	grease pre-applied

\* grease pre-applied on FR · FRA type

NB provides the following optional greases. Please select one in accordance with the use conditions of your linear system.

### KGL Grease (Low Dust Generation Grease)

KGL Grease has an excellent property of low dust generation with a lithium-type thickening agent used. It is ideal for use in a clean room.

### KGU Grease (Low Dust Generation Grease)

With urea-type thickening agent used, KGU Grease has features including a superior low dust generation property and the reduced dynamic frictional resistance during low-speed operation.

Table 1-38 Main Property

item	grease name	
	KGL Grease	KGU Grease
appearance	light yellowish-white	light brown
base oil	synthetic oil and refined oil mixed	synthetic oil and refined oil mixed
kinematic viscosity of base oil (mm <sup>2</sup> /s, 40°C)	32	approx. 85

total cycles	46 million cycles

Figure 1-21 Raceway Condition after Testing

## ●Other Grease

In addition to KGL, KGU, and KGF Greases, NB also provides K Grease, urea-type low dust generation grease.

Table 1-41 Main Property

item	grease name K Grease
appearance	yellow white
thickening agent	urea-type
base oil	synthetic oil
viscosity	280 (No.2)
operating temperature range (°C)	-30~150

## ●Grease for the food processing industry (NSF H1 certified) is available.

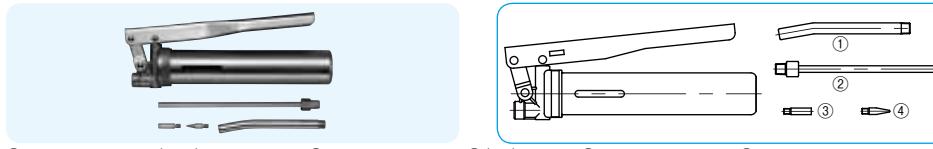

It is the most suitable combination for the food processing applications to use this type of grease with stainless steel products. Please contact NB for details.

## NB MAINTENANCE KIT

There are two types of maintenance kit available at NB.

### 1. Grease Gun Set: GG1

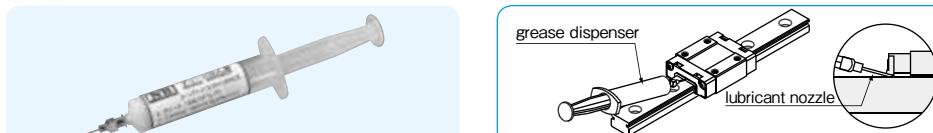

Different types of nozzles are adaptable to a variety of products including Actuators and products with grease-fitting.

In the case of difficulty in pumping, due to internal grease adhesion or shape of the bearing, please use nozzle ④ to apply grease directly onto running grooves.

### 2. Grease Dispenser: TU1

Syringe dispenser is recommended for miniature guide (SEBS-B type) and for limited space applications.

① Lubricant Nozzle (19G)  
Needle Diameter : φ1.00  
Needle Inner Diameter : φ0.67 (for KGF Grease)  
② Lubricant Nozzle (17G)  
Needle Diameter : φ1.50  
Needle Inner Diameter : φ1.03 (for KGL·KGU Grease)

## PRECAUTIONS FOR HANDLING AND USE

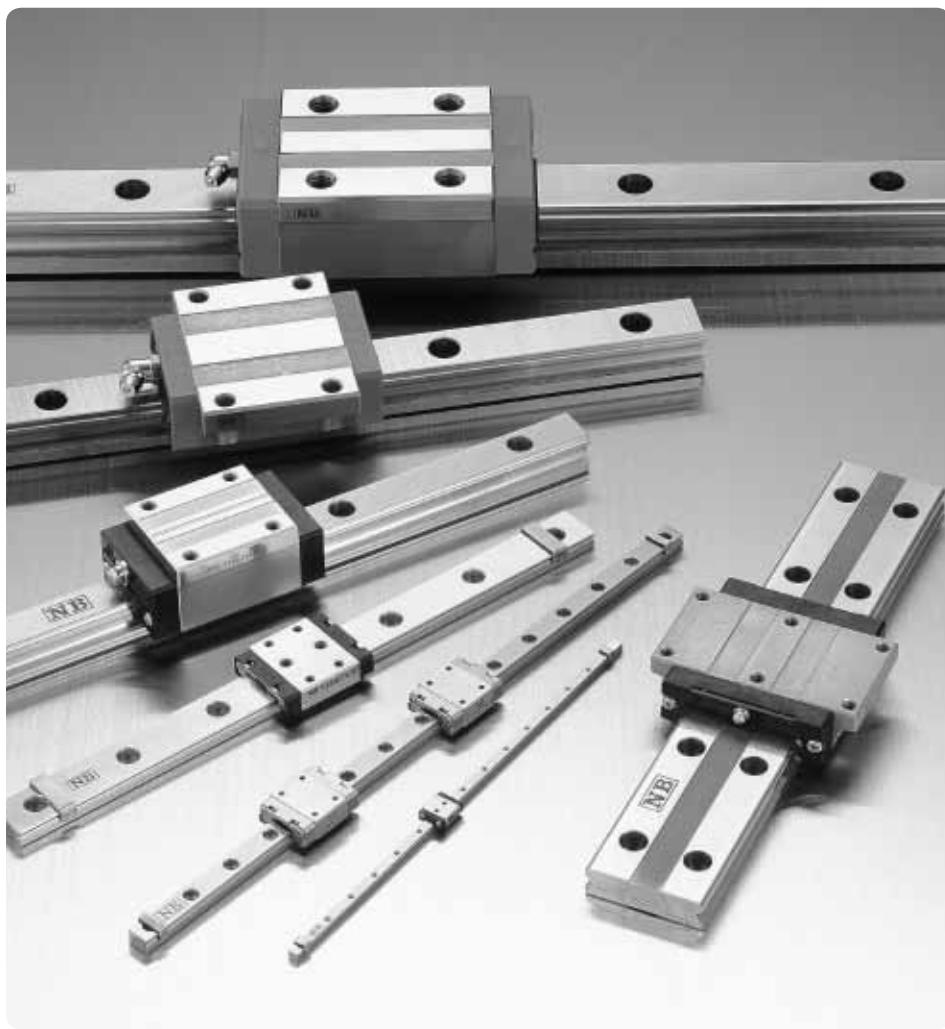

Please follow the instructions below to maintain the accuracy of NB linear system as a precision part and for a safety use.

- ⚠ (1) Notes on Handling
  - ① Any shock load caused by rough handling (such as dropping or hitting with hammer) may cause a scar or dent on the raceway which will hinder smooth movement and shorten expected travel life. Also be aware that such impact may damage the resin parts.
  - ② Never try to disassemble the product. Doing so may cause an entry of contamination or deterioration of assembly accuracy.
  - ③ The blocks or the outer cylinders may move just by tilting the rail or the shaft. Be careful not to let them fall off from the rail or the shaft by mistake.
  - ④ The accuracy on the mounting surface and parallelism of the rails or the shafts after assembly are important factors to optimize the performance of the linear system. Exercise adequate care for mounting accuracy.
- ⚠ (2) Notes on Use
  - ① Be careful not to let dust or foreign particles enter the linear system during use.
  - ② When using the linear system under an environment where dust or coolant may scatter, protect the system with a cover or bellows.
  - ③ When the NB linear system is used in a manner that its rail is fixed to the ceiling and downward load is applied to the block(s) or the outer cylinder(s), if the block or the outer cylinder breaks, it may fall off from the rail and drop to the floor. Provide additional measures for preventing dropping of the block or the outer cylinder, such as a safety catch.
- ⚠ (3) Instructions in considering the "Life Time" of a Linear System
  - ① When the load applied to a block or an outer cylinder exceeds 0.5 time of the basic dynamic load rating ( $P > 0.5C$ ), the actual life of the system may become shorter than a calculated life time. Therefore, it is recommended to use the system with 0.5C or lower.
  - ② In the repetition of very minute stroke, where the rolling element, a steel ball or a cylindrical roller, makes only less than a half turn, early wear called fretting occurs at the contact points between the rolling elements and the raceway. There is no perfect measure to avoid this, but the life of the system can be extended by using anti-fretting grease and moving the blocks or the outer cylinders for the full stroke length once in a few thousand times of use.
  - Anti-fretting grease is available as an option. Please select it for applications with very minute stroke length.

# SLIDE GUIDE

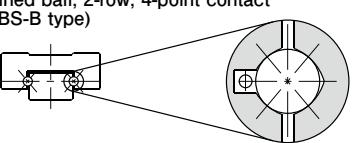

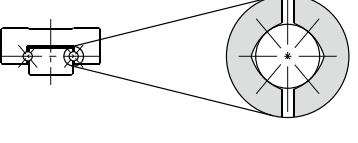

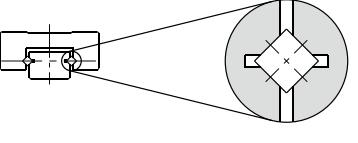

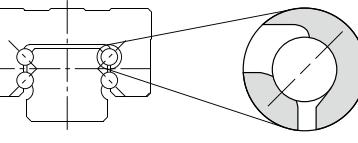

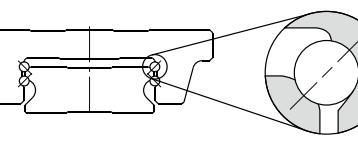

# SLIDE GUIDE

NB slide guides are high-precision and high-rigidity linear bearings designed to utilize the motion of rolling elements. They have numerous advantageous characteristics including low friction, no stick-slip, and smooth linear motion even under high load conditions. Since they can maintain their high-efficiency and high-functionality characteristics for an extended period of time, they meet a wide range of needs, from general industrial to precision machinery.

## TYPES

Table A-1 Types

rolling element	cross section and contact structure	advantages	page
miniature type	retained ball, 2-row, 4-point contact (SEBS-B type) 	<ul style="list-style-type: none"> <li>retained ball type</li> <li>available with all stainless steel components</li> <li>2-row, compact</li> <li>small, light, cost effective</li> </ul>	P.A-20
	2-row, 4-point contact (SEB-A type) 	<ul style="list-style-type: none"> <li>2-row, compact</li> <li>small, light, cost effective</li> <li>available in various types</li> <li>available in stainless steel</li> </ul>	P.A-20
high-rigidity type	cross roller (SER type) 	<ul style="list-style-type: none"> <li>miniature roller guide</li> <li>cross roller, high precision</li> <li>available with all stainless steel components</li> </ul>	P.A-42
	4-row, 2-point contact (SGL type) 	<ul style="list-style-type: none"> <li>high self-centering characteristics</li> <li>high load capacity due to relatively large ball elements</li> <li>high dust preventive control with side-seals and under-seals</li> <li>available in stainless steel</li> </ul>	P.A-50
	4-row, 2-point contact (SGW type) 	<ul style="list-style-type: none"> <li>high-moment resistant</li> <li>low-height design</li> <li>smooth motion due to large number of effective balls</li> <li>high dust preventive control with side-seals and under-seals</li> </ul>	P.A-72

## ACCURACY MEASUREMENT METHOD

The accuracy of slide guides is measured by fixing the rail to the reference base. The accuracy is expressed in terms of the average value at the center portion.

### Dimensional Tolerance and Paired Difference

The accuracy of the slide guide is obtained by measuring the height  $H$ , and width  $W$ , as shown in Figure A-1. The dimensional tolerance is measured for each of the blocks attached to the rail and is expressed in terms of the deviation from the basic dimension. The paired difference is obtained by measuring the blocks attached to the rail and is expressed in terms of the difference between the maximum and minimum values.

### Motion Accuracy

The rail is first fixed to the reference base. The motion accuracy is obtained by measuring the difference in the indicator readings when the block is moved along the entire span of the rail.

Note: Gauge head is placed on the center of the block reference surface.

### Notation for Number of Axes and Paired Difference

When more than one rail is used in parallel, the dimensional difference must be measured on more than one block on more than one rail. For measuring the paired difference for height  $H$ , please specify the number of axes ( $W2$ ,  $W3$ ) as the part number example shows. For measuring the paired difference for width  $W$ , please contact NB.

Note : When four rails are used as illustrated in Figure A-3, W4 should be specified in the part number. Please indicate the number of axes when ordering.

Figure A-1 Accuracy Measurement

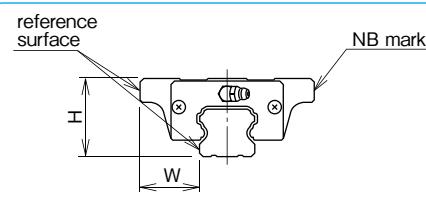

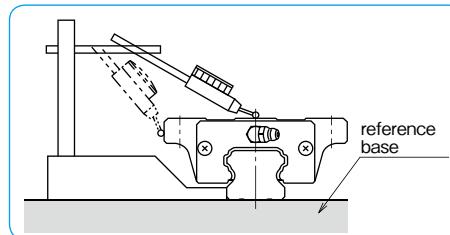

Figure A-2 Measurement Method for Motion Accuracy

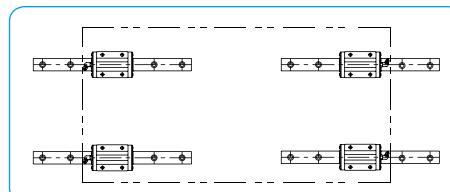

part number example

**SGL25TF2-350/W2**

symbol for number of axes  
W2: 2 parallel axes  
W3: 3 parallel axes

Figure A-3 4 Parallel Axes

## RIGIDITY AND PRELOAD

The rolling elements of the slide guide deform elastically due to the applied load. The amount of deformation depends on the type of rolling element. It is proportional to the 2/3rd power for ball elements. For rollers, it is proportional to the 0.9th power. In either case, the rate of deformation decreases as the applied load increases. Greater rigidity is achieved by applying a preload.

A preload causes internal stress within the slide guide block, resulting in some reduction in lifetime. However, when the guide is used under shock or vibration loading conditions, a preload will absorb the load and will actually help lengthen the life time. Because the preload causes elastic deformation of the rolling elements, it becomes less tolerable to the installation dimensional errors. Extreme care should be exercised in machining the installation surface.

Four levels of preload are available: clearance, standard, light, and medium. This allows the user to select the appropriate level for the application.

Figure A-4 Elastic Deformation of Rolling Elements

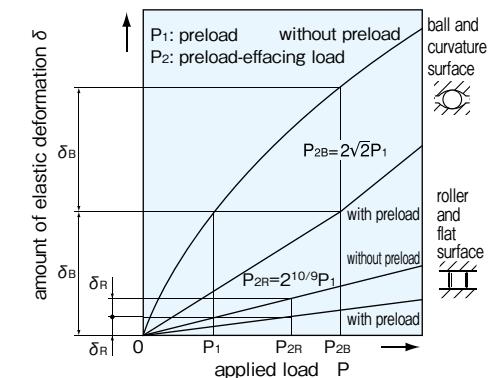

Table A-2 Level of Preload

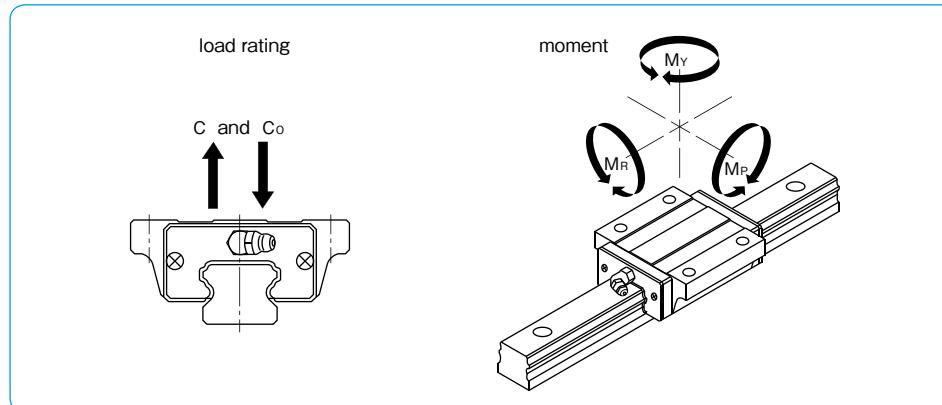

preload	symbol	effect of preload					operating conditions	applicable part number
clearance	T0						light motion is required. installation errors to be absorbed.	SEB
standard	blank						minute vibration is applied. accurate motion is required. moment is applied in a given direction.	SEB, SGL SGW
light	T1						light vibration is applied. light torsional load is applied. moment is applied.	SEB, SGL SGW
medium	T2	increases	reduces	reduces	increases	increases	shock and vibration are applied. over-hang load is applied. torsional load is applied.	SGL, SGW

## LOAD RATING AND RATED LIFE

### Loading Direction and Load Rating

A slide guide experiences load and moment, as shown in Figure A-5. For each load and moment, the basic load ratings and allowable static moments are defined.

Figure A-5 Direction of Load

### Rated Life Calculation

Two types of rolling elements are used in NB slide guides: ball and roller elements. There is a different equation for calculating the rated life of each type.

For ball elements  
(SEB, SGL, and SGW types), the equation is

$$L = \left( \frac{f_c \cdot f_T \cdot C}{f_w} \right)^3 \cdot 50$$

For roller elements  
(SER type), the equation is

$$L = \left( \frac{f_c \cdot f_T \cdot C}{f_w} \right)^{10/3} \cdot 50$$

L: rated life (km)    f<sub>c</sub>: contact coefficient  
f<sub>T</sub>: temperature coefficient    f<sub>w</sub>: applied load coefficient  
C: basic dynamic load rating (N)    P: applied load (N)  
※ Refer to page Eng-5 for the coefficients.

※ The contact coefficient is applied when two or more blocks are used in close contact.

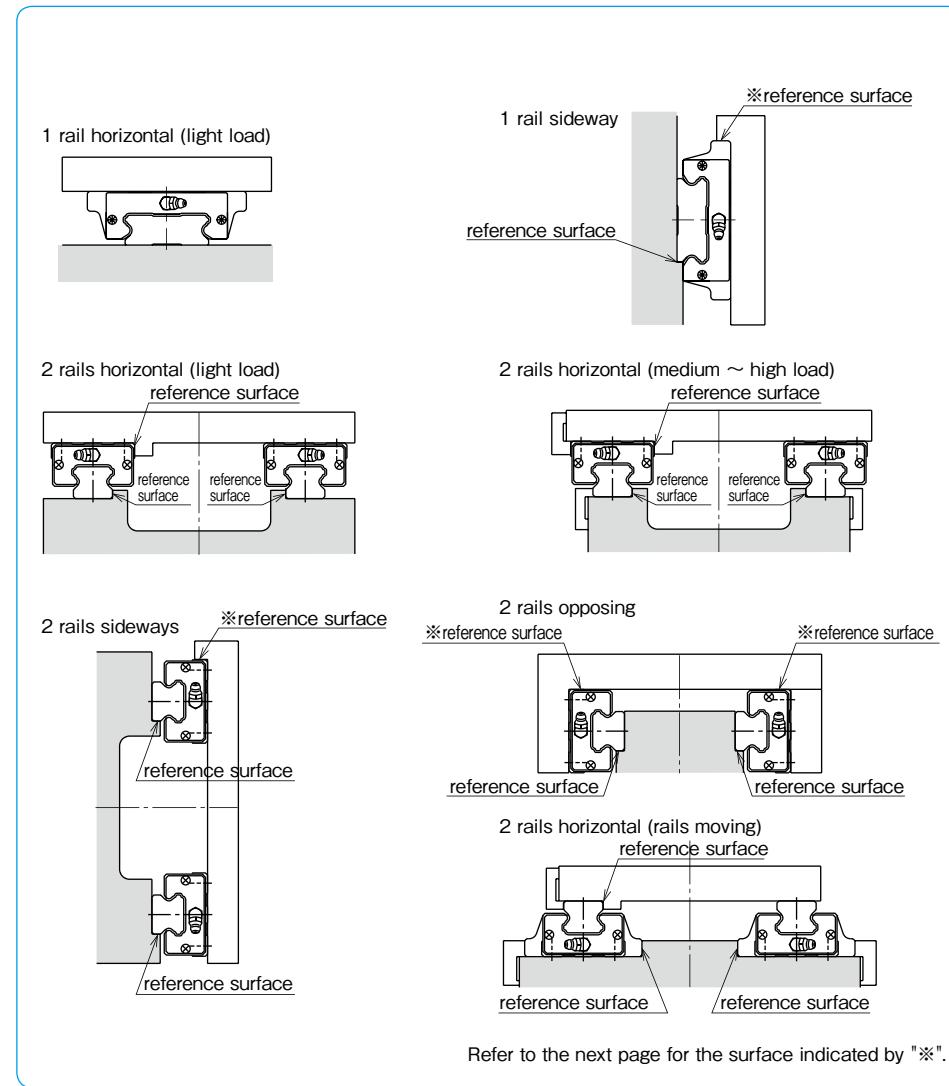

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_i \cdot 60}$$

L<sub>h</sub>: life time (hr)    l<sub>s</sub>: stroke length (m)  
L: rated life (km)    n<sub>i</sub>: number of cycles per minute (cpm)

## MOUNTING

Slide guides have high load ratings in spite of their compact size. They can be used in various types of machinery and other equipment in various configurations. Figure A-6 shows some typical slide guide arrangements.

Figure A-6 Slide Guide Arrangements

Refer to the next page for the surface indicated by "※".

## Mounting Surface and Accuracy

NB slide guides are designed and fabricated to achieve high accuracy after mounting them to a machined mounting base. One typical way is to provide a shoulder on the mounting surface and align the reference surface of the rail or block against the shoulder (Figure A-7). To avoid corner interference, an undercut should be provided at the shoulder corner. Alternatively, the radius of the shoulder corner should be smaller than the radius of the slide guide block/rail corner.

The accuracy of the rail mounting surface affects the accuracy of the machinery or equipment along with the slide guide motion accuracy.

The accuracy of the mounting surface should be equivalent to that of the slide guide motion accuracy. The specified preload may not be achieved due to deformation of the block, for example, the mounted block surface is not flat (Figure A-8). Careful attention should therefore be given to achieve the specified flatness.

Note: Please contact NB for the rail straightness in case the mounting shoulder cannot be provided or the rigidity of the mounting surface is not enough.

## Reference Surface Indication

Reference surfaces are provided to enable accurate and simplified mounting. They are located on the same side, as shown in Figure A-9, opposite to the NB mark.

Depending on the mounting arrangement, the standard reference surface may not ensure mounting accuracy (for example, 1 rail sideways or 2 rails opposing, Figure A-6, page A-7). In such cases, NB can provide a reference surface on the opposite side. Please specify the side when ordering.

Figure A-7 Profile of Mounting Reference Surface

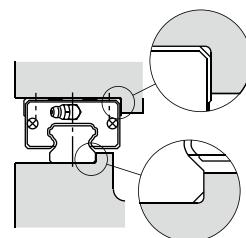

Figure A-8 Effect of Flatness

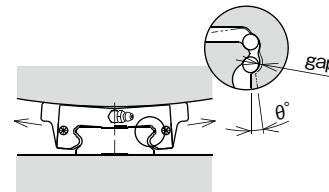

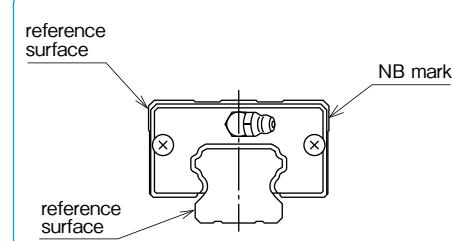

Figure A-9 Reference Surface

## Mounting

In general, slide guides are used with 2 rails in parallel. In that case, one rail is on the so-called reference side and the other is on the so-called adjustable side.

- Applications where shock/vibration and high load are involved/high accuracy is required. The effect of shock and vibration on accuracy is eliminated by using side pieces such as side plates (Figure A-10), tightening set screws (Figure A-11), or tapered gibbs (Figure A-12).

Figure A-11 Using Tightening Set Screw

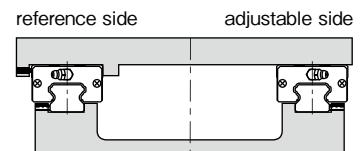

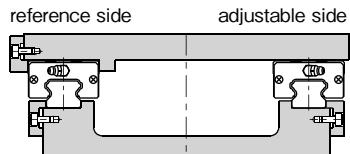

Figure A-10 Using Side Plate

Provide an undercut in the side plate, and fix the table and rail from the side.

- Applications where light load and low speed are involved.

Figures A-13~15 show the mounting methods when high accuracy is not required or the load capacity of the slide guide is sufficient due to a light load or low speed. In these cases, side pieces or reference surface may not be required.

Figure A-12 Using Tapered Gib

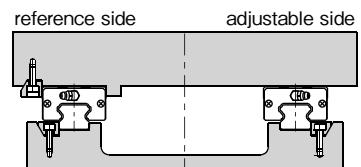

Figure A-14 No Reference Surface on Adjustable Side

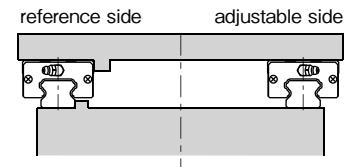

Figure A-13 Without Side Piece

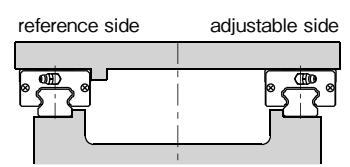

Figure A-15 Without Reference Surface

## Mounting Procedure

When reference surfaces are provided for both the table and the base, please follow the following procedure to mount the slide guide.

1. Remove burrs, scratches, dust, etc. from the base and table. Apply a low viscosity oil to the base and the table. Place the slide guide on the base carefully. Temporarily fix the rail mounting screws. (Figure A-16a)

2. Tighten the screw for the side piece so that the installation reference surface and the rail reference surface are in close contact. (Figure A-16b) If a side piece is not provided, use a C clamp to position the mounting reference surface and the rail reference surface so that they contact each other. (Figure A-16d)

3. Tighten the mounting screws to the specified torque, and complete the mounting of the rail. The rail is designed so that its accuracy is optimum when the screws are tightened to the specified value. Please refer to the recommended torque table for each product type. (Figure A-16c)

4. Repeat steps 2 and 3 for the rail on the adjustable side.

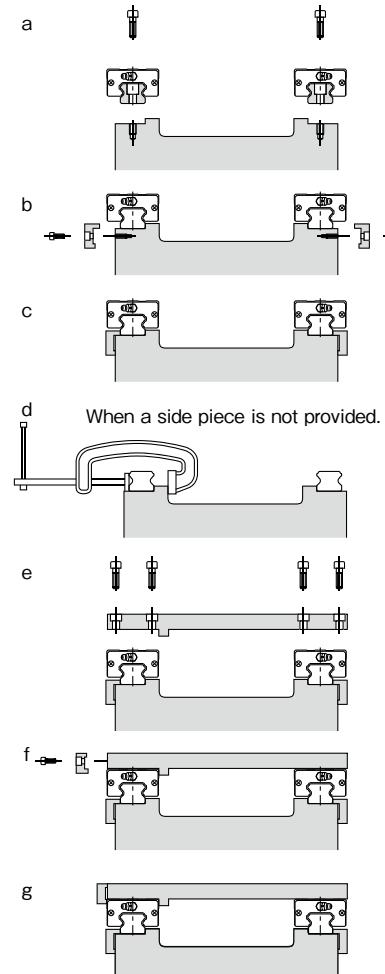

5. Move the blocks at the mounting location of the table, and place the table gently. Then slightly tighten the screws. (Figure A-16e)

6. Fix the reference surface of the block against the table by the side piece. Tighten the mounting screws in a diagonal sequence. (Figure A-16f)

7. In the same manner, tighten the mounting screws for the blocks on the adjustable side. (Figure A-16g)

8. Finally, move the table through the stroke length to check if thrust is even. Please repeat 5 and 6 ( 2 to 6 when necessary) if thrust is not even. If thrust is even, please do final tightening of the screws.

Figure A-16 Mounting Method

## When Reference Surface is Not Provided on Adjustable Side

When a reference surface is not provided on the adjustable side, mount the 2 rails in parallel by using a jig, as mounted in Figure A-17. After mounting the reference-side guide, install the adjustable-side guide by moving the table to achieve parallelism.

Figure A-17 Using a Jig

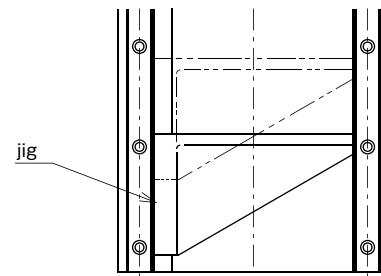

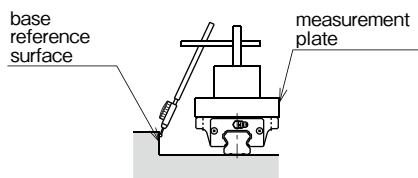

Figure A-18 Using Base Reference Surface

## When Reference Surface is Not Provided on Reference Side

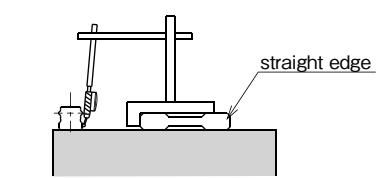

When a reference surface is not provided on the reference side, mount the 2 rails by using a reference surface close to the slide guide.

Temporarily fix the slide guide to the base, and mount an indicator on a measurement plate. Please fix the measurement plate on two or more blocks. (Figure A-18)

Place the indicator against the reference surface of the base. Tighten the screws from one end of the rail to ensure straightness.

If there is no reference surface close-by, use a straight edge to achieve straightness. (Figure A-19)

Figure A-19 Using a Straight Edge

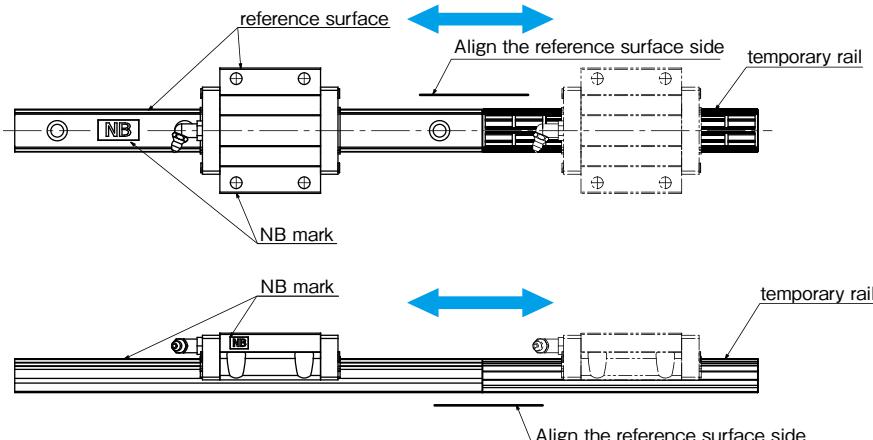

## NOTES ON HANDLING AND USE

NB Slide Guides are accurately tuned precision components. Please pay special attention to the following notes.

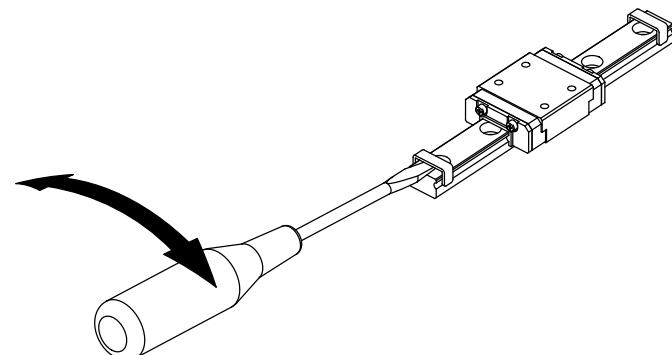

- Please install the Slide Guide as a set. It is not recommended to remove the block for installation.
- When block removal is necessary, please use a temporary (plastic dummy) rail to prevent balls from dropping out.
- To put a guide block on the rail, as the pictures below show, align the reference surface and the height between the rail and a temporary rail. It is very important to maintain the original combination of block(s) and rail.

Figure A-20 How to Put Guide Block on

- Please do not turn around a block on the rail to change the grease-fitting orientation. Relocate fitting to the opposite end by removing red plug, and re-insert red plug to where fitting was originally.
- Never try to disassemble the block. This will most assuredly void warranty of the product.
- Please remove burrs, dust, or any other debris from the base and table before installation.
- Slide Guides are pre-lubricated for immediate use. Please relubricate with a similar type of grease regularly. Special lubricants must be matched with the same type of grease to prevent contamination.
- The SEB(S) and SER(S) Slide Guides have metal clip stoppers (picture below) to avoid a block fall-out during shipment and assembly. Please remove the stoppers only after installation is finished with a screwdriver as these clips should not be used as 'mechanical' stoppers.

Figure A-21 How to Take Off Metal Clip

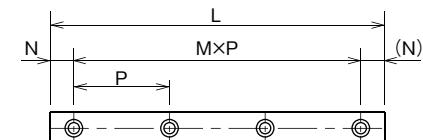

## RAIL LENGTH

### Guide Rail Length

Please refer to the maximum rail length for each type and size on the dimension table. Unless otherwise specified, the distance from one end of the rail to the first hole center (referred to as dimension "N") is within the range specified in the N dimension tables, satisfying the following equation. Please specify the N dimensions when out of the range.

$$L = M \cdot P + 2N$$

Figure A-22 Rail

L: length (mm) P: hole pitch (mm)  
N: distance from the end of the rail to the first hole center (mm)  
M: number of pitches.

## JOINT RAILS

Rails can be joined together to obtain a length which exceeds the maximum length. There are two ways to do this.

- Place the joints at the same location for the right and left rails so as to make the design and maintenance simple (Figure A-23 ①).
- Place the joints for the right and left rails at different locations so that the block does not move over the two joints at the same time so as to minimize the effect of the joint on accuracy (Figure A-23 ②).

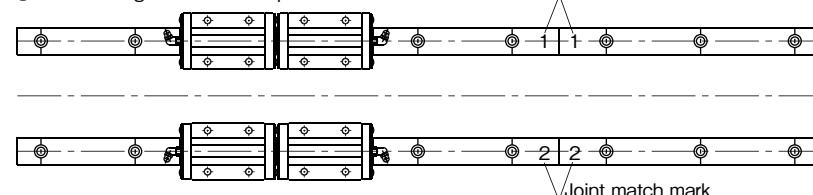

Please keep the following points in mind when using joint rails.

- To avoid dislocation at joints due to shock loading, provide a shoulder at the joint on the installation side.
- If a shoulder cannot be provided, make sure that any excess load does not change the rail position.
- Use the joint marks provided for installation.
- Tightly butt the rails to be joined so that there is no gap between them.
- Make sure the reference surface side of the joint rails to be aligned.

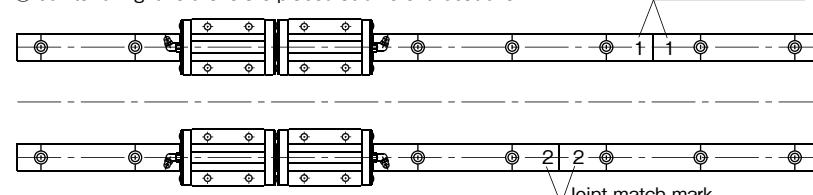

Note: Joined rails are available for SGL and SGW series with standard grade, high grade, and with standard preload.  
For joined rails on SEB series, please contact NB. Joined rails are not available for SER series.

Figure A-23 Examples of Joined Guide Rails

- ① Joints for right/left rails are placed at the same location

- ② Joints for right/left rails are placed at different locations

## DUST PREVENTION

### Seals

#### Side-Seal

(Series: SEB, SER, SGL, and SGW)

The side-seals prevent foreign particles and dust from entering the guide block in order to retain the motion accuracy, resulting in a long life time.

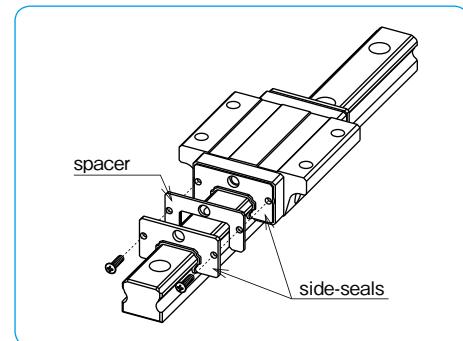

#### Under-Seal (Series: SGL and SGW)

Slide guides with side and under-seals are used in harsh environments or to prevent dust entering from below.

#### Double Side-Seal Option (Series: SGL)

With this option, the prevention against dust is greatly improved. Ideal for use in applications where bellows or covers are not able to be fitted over the slide guide system.

Figure A-25 Double Side-Seal

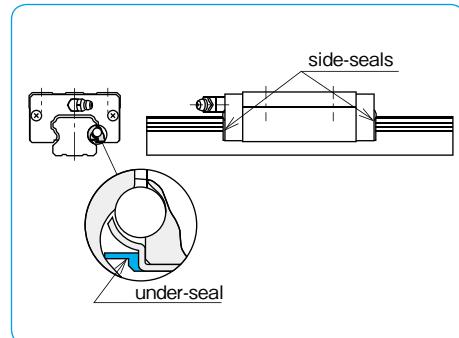

#### No Side-Seal (Series: SEB and SER)

When the presence of dust or debris is extremely low and only minor motion resistance is desired, a no side-seal option is available. Be aware that, with this option, dust prevention can not be expected.

#### Double Side-Seal + Scraper Option (Series: SGL)

Double side-seal plus scraper is also optional. Please contact NB for details.

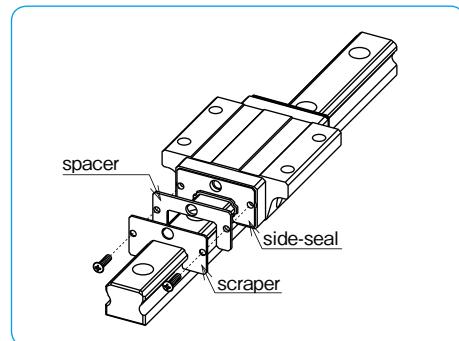

Figure A-24 Side-Seal and Under-Seal

#### Scraper Option (Series: SGL)

When the application environment has unfavorable foreign matter or debris such as welding splatter or cutting debris, the scraper option provides an effective protective measure for the slide guide system.

Figure A-26 Scraper

#### Bellows Option (Series: SGL)

This option fully covers the guide rail preventing dust, debris, and other foreign particles from disrupting the smooth linear motion. (Refer to page A-18 for further details)

Figure A-27 Bellows

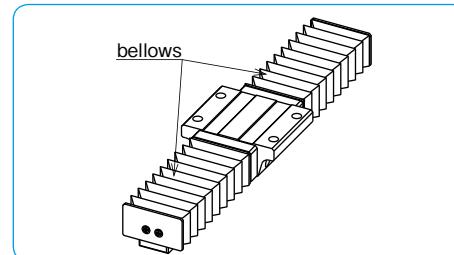

Figure A-28 Special Cap

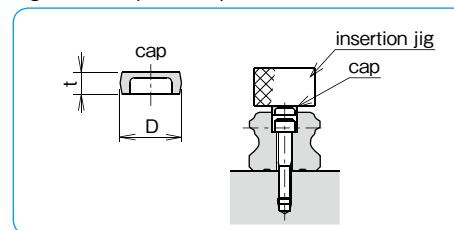

Table A-3 Special Cap

part number	dimensions		applicable part number		
	D mm	t mm	SGL-F,E, TF,TE	SGL-HTF,HYF HTE,HYE,HTEX	SGW

F 5	9.7	2.5	20	20	—
F 6	11.2	2.7	25,30	25	35
F 8	14.3	3.65	35	30,35	—
F12	20.3	4.65	—	45	—

## ANTI-CORROSION

For anti-corrosion, the SEB/SER series and SGL-F/TF types are available in stainless steel material. Low temperature black chrome treatment can be specified for the SGL and SGW series. This treatment (LB) is suitable for applications where corrosion resistance is a requirement.

## LUBRICATION

Lithium soap based grease is applied to NB slide guides prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions.

The [Fiber Sheet](#) and Reverse-Seal are available which significantly extends relubrication period (refer to page A-16, A-17).

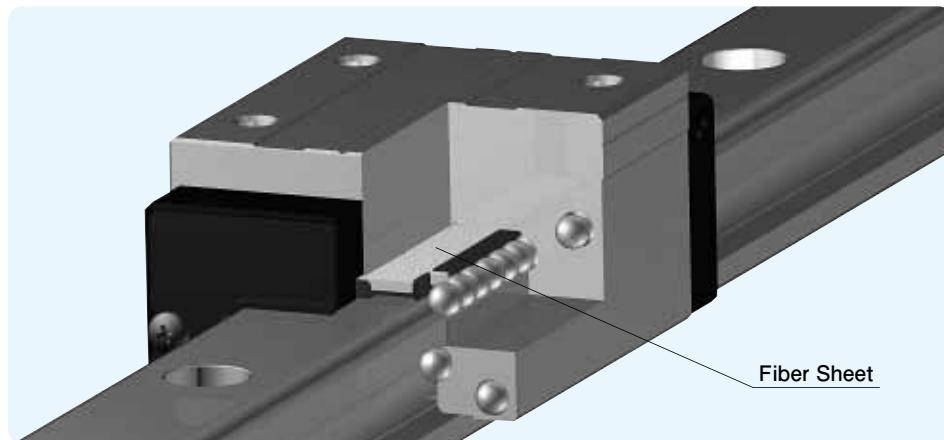

For use in clean rooms or vacuum environments, slide guides without grease or slide guides with customer specified grease are also available. Please contact NB.

NB also provides low dust generation grease. Please refer to page Eng-39 for details.

## FIBER SHEET

The Fiber Sheet for the SGL and SGW types, significantly extends lubricant replenishment intervals and has an excellent durability even under harsh conditions with dust and debris that absorb lubricant. Embedded in a block body, as shown in Figure A-29, it does not change the length of the block. In addition, the Fiber Sheet does not require any change in mounting dimensions, which allows replacement with existing products without a design change.

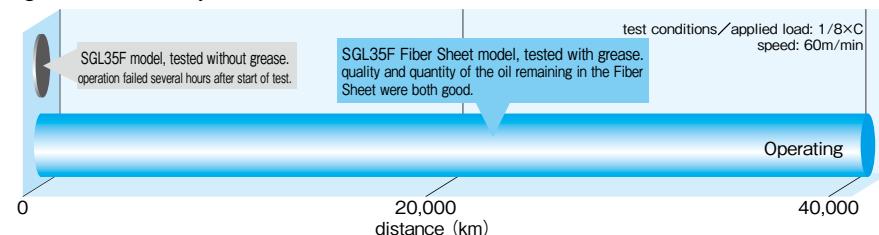

Figure A-29 Magnified View of the Fiber Sheet

### Simplified Lubrication Management

NB's Fiber Sheet is a fiber material with a porous structure containing the lubricant oil. The oil is supplied to the ball elements at the proper time and with the proper amount by the principle of capillarity, greatly increasing the relubrication period.

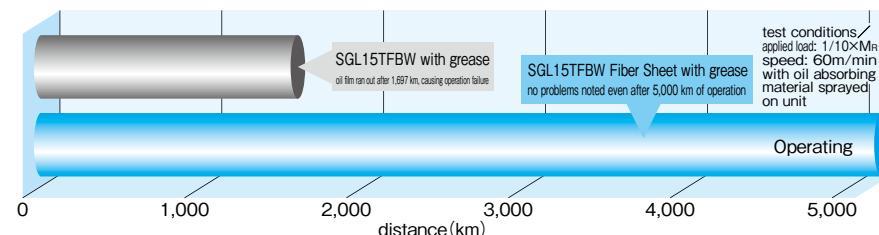

Figure A-30 Durability Test

### Outstanding Durability Even Under Poor Operating Conditions

An acceleration test was performed with oil absorbing material sprayed on the units to validate the SGL type's lubrication performance and durability even under poor operating conditions.

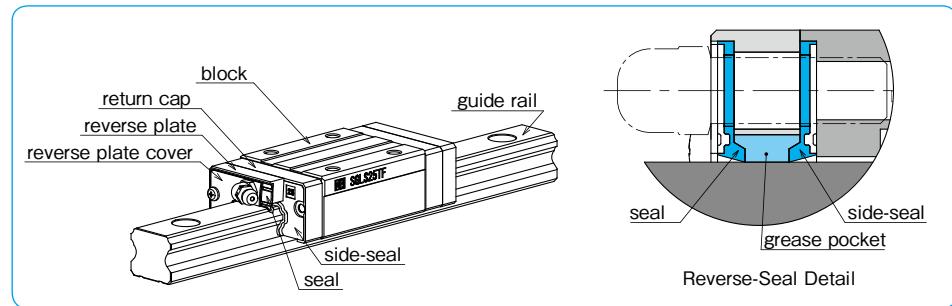

Figure A-31 Lubrication Acceleration Test

## REVERSE-SEAL

NB's Reverse-Seal is a seal unit that consists of reverse plate, seal, and cover. This seal unit has another side-seal in the reverse orientation to the block, which achieves maintenance free by reducing grease loss.

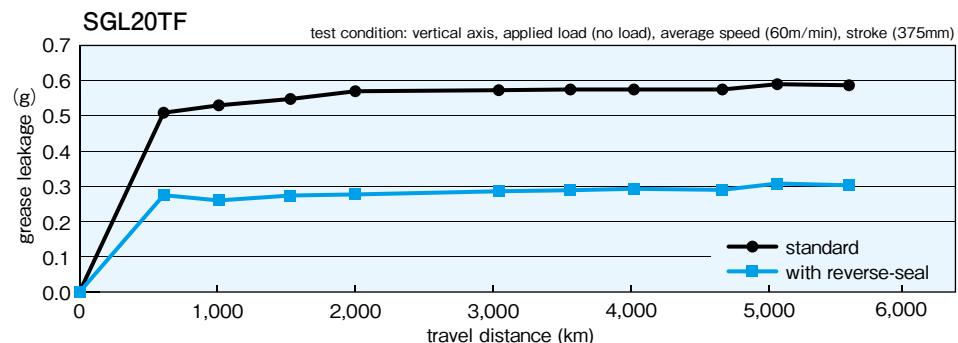

Figure A-32 Reverse-Seal

### Reducing Grease Leakage

The space between two seals holds grease to minimize a grease leakage from the block.

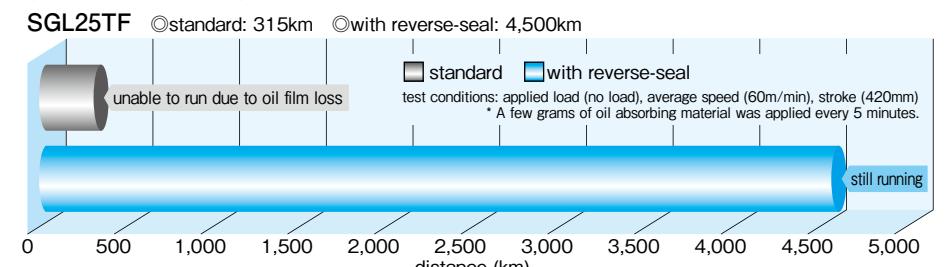

Figure A-33 Grease-leak Test Data

### Maintenance Free

Reverse-seal makes a "Grease Pocket" between two seals that realizes maintenance free by reducing grease leakage and loss.

Figure A-34 Grease Dry-up Test Data

### Applicable Part Number

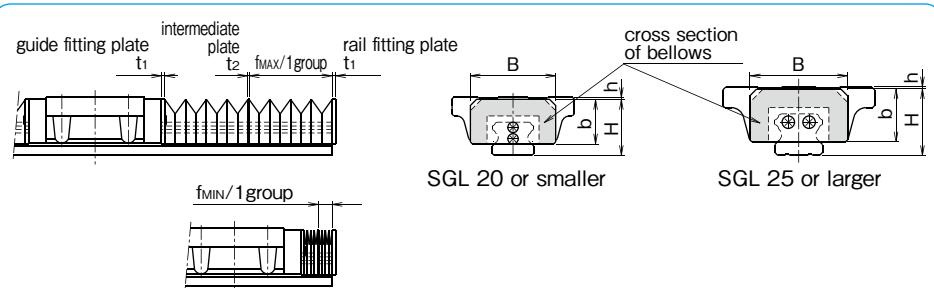

Reverse-Seal (BR option) is available on SGL15,20, and 25.

## BELLOWS

By protecting the entire length of the guide rail, the dust prevention is greatly enhanced.

Please refer to Figure A-35 for dimensions. External dimensions and the stroke length of slide guide will change with use of bellows.

Figure A-35 Dimensions of Slide Guide with Bellows

Note: Please do not unfasten the guide fitting plate screws. The slide guide becomes unfunctional if the guide fitting plate is removed.

part number	B	H	h	b	t <sub>1</sub>	t <sub>2</sub>	f <sub>MAX/1 group</sub>	f <sub>MIN/1 group</sub>

SGL25F/TF/E/TE								
SGL25HTF/HYF	58	40	8	4	1.0		56	
SGL25HTE/HYE/HTEX								
SGL30F/TF/E/TE	68	46	2	31			68	
SGL30HTF/HYF								
SGL35F/TF/E/TE	84	59	5	2	1.0		72	
SGL35HTE/HYE/HTEX								
SGL35HTF/HYF	84	59	9	37				
SGL45HTE/HYE/HTEX								
SGL45HTF/HYF	84	59	11	50	2.0			

Note: 1 group indicates the minimum unit of bellows. Please specify the required stroke length.

When bellows are fitted to the guide block, the grease fitting cannot be installed.

The allowable temperature is up to 60°C if the system has a bellows option.

Please contact NB for details on the installation of bellows, as well as for special application usage.

## Calculation Method of Length of Bellows and Slide Guide Rail

Example: In this case, one(1) piece of SGL15TE guide block is mounted on a rail with bellows; the required stroke is 440mm.

Number of groups required for a stroke of 440mm is calculated as follows.

$$\frac{\text{Stroke}}{\text{f}_{\text{MAX}} - \text{f}_{\text{MIN}}} = \frac{440}{32 - 6.5} = 17.2 \approx 18 \text{ groups (round up)}$$

When 18 groups of bellows are fitted, the maximum length  $f_1$  is calculated:

$$f_1 = \text{guide fitting plate} + 1 \text{ group } f_{\text{MAX}} \times \text{number of groups} + \text{Intermediate plate} \times (\text{number of groups} - 1) \\ = 1.5 + 32 \times 18 + 1.0 \times (18 - 1) = 594.5$$

When 18 groups of bellows are fitted, the minimum length  $f_2$  is calculated:

$$f_2 = \text{guide fitting plate} + 1 \text{ group } f_{\text{MIN}} \times \text{number of groups} + \text{Intermediate plate} \times (\text{number of groups} - 1) \\ = 1.5 + 6.5 \times 18 + 1.0 \times (18 - 1) = 135.5$$

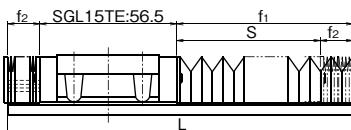

With these calculation results, stroke limit (S) and length of the guide rail needed (L) are obtained as follows:

$$S = f_1 - f_2 = 594.5 - 135.5 = 459$$

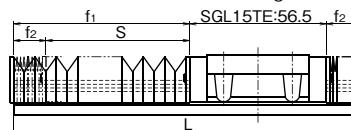

$$L = f_1 + f_2 + \text{SGL15TE block} = 594.5 + 135.5 + 56.5 = 786.5 \approx 787 \text{ (round up)}$$

Figure A-36 External Diagram of Slide Guide with Bellows Attached

When Slide Guide is moved to the right end

## SEB TYPE AD PROFILE (Anti-Deforming)

The AD profile guide block can dissipate possible deformation by improved installation plane profile.

Figure A-37 SEB type AD profile

### Note:

When NB's unique AD Profile type miniature guide block is selected, the following precautions should be taken into consideration to perform to its utmost advantage.

- To obtain maximum AD (Anti-Deforming) effect, flatness of the mounting surface should be finished the same as motion accuracy of the slide guide.
- When the table is designed with one guide block on one guide rail, the utmost AD effect is anticipated.
- All screws on the slide guide block should be tightened to the equal torque value.
- The AD profile type guide block is available only with standard preload.
- AD profile type guide blocks are available only with following part numbers of slide guide block.

# SLIDE GUIDE Miniature SEB Type

The NB slide guide SEB type is a linear motion bearing in which the ball elements roll along two raceway grooves. This is the smallest and lightest slide guide series offered by Nippon Bearing. The compact design allows for the size and weight of machinery and other equipment to be reduced.

## STRUCTURE AND ADVANTAGES

The SEB type slide guide consists of a rail with precisely machined raceway grooves and a block assembly consisting of the main body, return caps and ball elements.

### Retained Ball

Because of the ball retainers, the SEBS-B type is able to be removed from the guide rail, simplifying its installation and resulting in lower assembly costs.

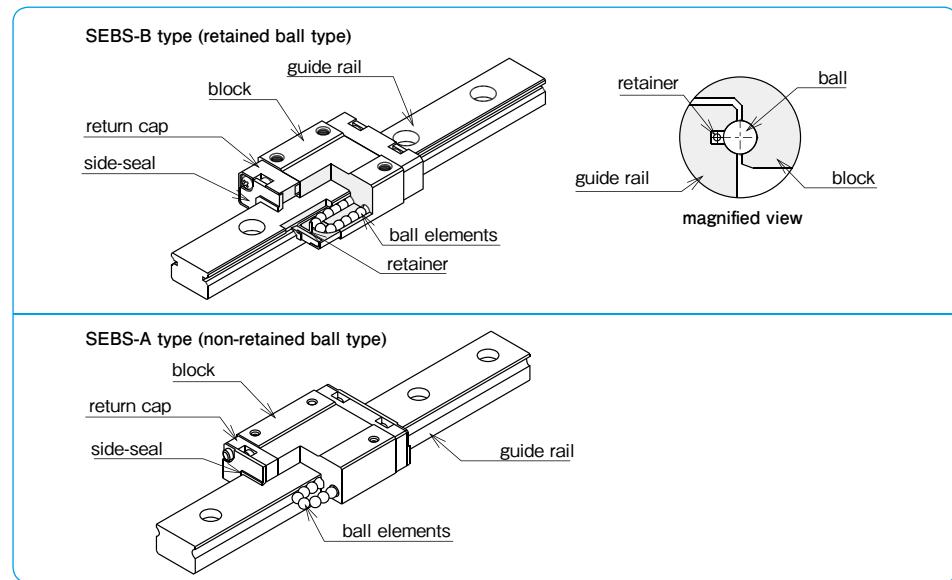

### All Stainless Steel Type

By using stainless steel for the return caps, the SEBS-BM type is made of all stainless steel components, making it the ideal choice for special environments such as high temperature, clean room, or vacuum applications.

### Moment Resistant

A wide block (WB/WA) type, a long block (BY/AY) type, and a wide/long block (WBY/WAY) type are moment resistant slide guide types. The most

Figure A-38 Structure of SEB type Slide Guide

suitable type can be selected for any demanding operating condition.

### Tapped Hole Rail Type

For the SEB rails, counterbore (standard) and optional tapped hole (N) types are available enabling various installation methods.

### Compact Design

SEB type has a 2-row, 4-point contact structure. This structure minimizes the installation height, which contributes to light-weight and miniaturization of machinery and equipment.

### AD Profile

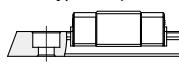

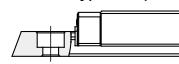

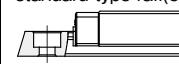

AD profile dissipates guide block deformation caused by installation. (refer to page A-19)

## TYPES

The SEB(S) type slide guides are categorized according to their block shape and the rail installation method.

Table A-5 Type

\*All the SEB blocks are made of stainless steel (SEBS marking).

## ACCURACY

The SEB(S) slide guides are available in two grades of accuracy: high grade and precision grade (P).

Table A-6 Accuracy unit/mm

accuracy grade	high	precision
accuracy symbol	blank	P
allowable dimensional difference in height H	$\pm 0.020$	$\pm 0.010$
paired difference for height H	0.015	0.007
allowable dimensional difference in width W	$\pm 0.025$	$\pm 0.015$
paired difference for width W	0.020	0.010
running parallelism of surface C to surface A	refer to figure A-39,40	
running parallelism of surface D to surface B		

Figure A-39 Accuracy

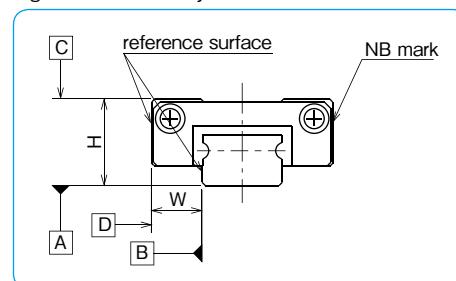

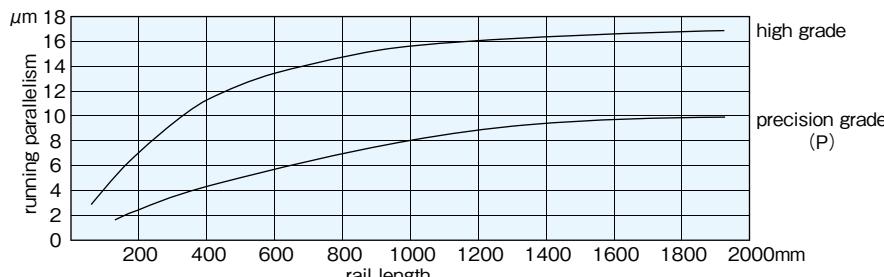

Figure A-40 Motion Accuracy

## PRELOAD

SEB(S) slide guides are available with a standard preload (blank), light preload (T1), and a positive-clearance (T0).

Table A-7 Preload Symbol and Radial Clearance unit/μm

size	preload and symbol		
	clearance T0	standard blank	light T1
2		—	—
3	+1~+3	—	—
5		-1~0	—
7	+3~+6		—
9	+3~+6		-4~-2
12	+4~+8		-3~0
15	+4~+8		-7~-3
20	+4~+8		-7~-3
3W	+1~+3	—	—
5W		-1~0	—
7W	+3~+6		-4~-2
9W	+3~+6		-3~0
12W	+4~+8		-7~-3
15W	+4~+8		-7~-3

Table A-8 Operating Conditions and Preload

preload	symbol	operating conditions
clearance	T0	light motion is required. installation errors to be absorbed.
standard	blank	minute vibration is applied. accurate motion is required. moment is applied in a given direction.
light	T1	light vibration is applied. light torsional load is applied. moment is applied.

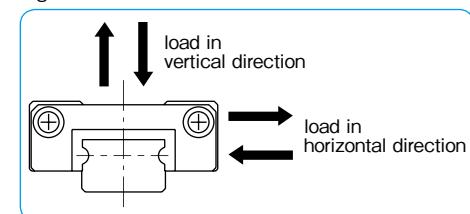

## LOAD RATING

The load rating for SEB(S) slide guides depends on the direction of load.

Table A-9 Load Rating

	rated ball type	non-retained ball type
basic dynamic	vertical	$1.00 \times C$
load rating	horizontal	$0.89 \times C$
basic static	vertical	$1.00 \times Co$
load rating	horizontal	$0.84 \times Co$

Figure A-41 Direction of Load

## EQUIVALENT LOAD

For a guide to which vertical load and horizontal load are applied at the same time, calculate its static equivalent load using the following equation.

$$P = Pa + X \cdot Ps$$

P: equivalent load Pa: vertical load Ps: horizontal load  
X: 0.84 for SEB-A type; 1.19 for SEBS-B type

## RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the ranges listed in Tables A-10 and A-11, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm) M: number of pitches P: hole pitch (mm)  
N: distance from the end of the rail to the first hole center (mm)

Table A-10 N Dimension (standard type) unit/mm

size	and over	N less than

## MOUNTING

### Mounting Surface Profile

Slide guides are mounted by pushing the reference surface of the rail and the block against the shoulder provided on the mounting surface. An undercut or a radius corner should be provided at the corner of the shoulder to prevent interference. The recommended shoulder height values on the mounting reference surface are shown in Table A-12. (Table A-13 for corner radius)

Figure A-43 Mounting Surface Profile-1

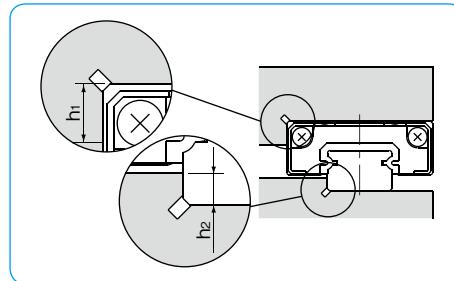

Table A-12 Shoulder Height on the Mounting Reference Surface unit/mm

size	shoulder height on the block side h <sub>1</sub>	shoulder height on the rail side h <sub>2</sub>
2	1	0.5
3	1.2	0.8
5	2	1
7	2.5	
9	3	1.5
12	4	2
15	5	3.5
20		5
3W	1.5	0.8
5W	2	1
7W	3	1.5
9W		
12W	4	2.5
15W	5	

### Recommended Torque Values

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table A-14. Please adjust the torque depending on the operating conditions.

Table A-14 Recommended Torque unit/N·m

size	M1	M1.4	M1.6	M2	M2.6	M3	M4	M5	M6
recommended torque	0.03	0.10	0.15	0.3	0.65	1.0	2.3	4.7	8.0

② cap screw

## LUBRICATION

A high grade lithium soap based grease is applied to the NB slide guides prior to shipment for immediate use.

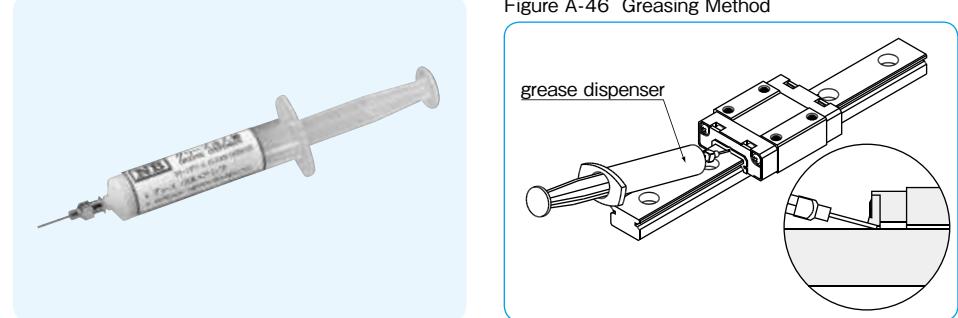

Please relubricate with a similar type of grease periodically depending on the operating conditions. For use in clean rooms or vacuum environments, NB slide guides without grease are available upon request.

Please contact NB for customer specified grease types.

A special syringe lubricant dispenser (refer to Figure A-46) is available from NB as an option. In particular, the SEBS-B retained ball type has a special structure that allows the user to replenish lubricant easily (refer to page Eng-42), as the magnified view of Figure A-46 shows.

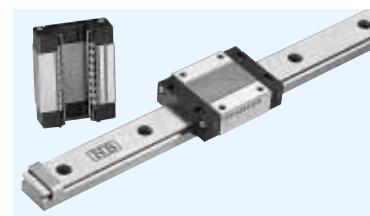

Please refer to page Eng-39 for details on the low dust generation grease.

# SLIDE GUIDE Miniature SER Type

The NB slide guide SER type is a linear motion bearing utilizing the rotational motion of precision rollers placed in two rows. Despite its compactness, it can be used in various applications requiring high load capacity.

## STRUCTURE AND ADVANTAGES

The SER type slide guide consists of a rail with two precision-machined raceway grooves and a block assembly. The block assembly consists of the main body, rollers, and bottom retainers. All of these components are made of metallic materials.

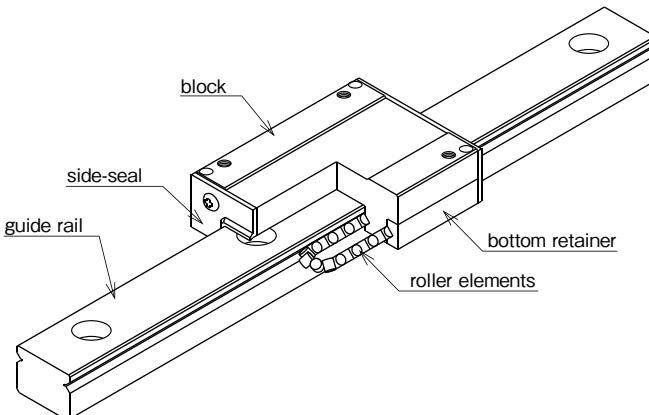

### High Load Capacity and Long Life

Since roller elements are used, the contact surface is large which provides a high load capacity and a long travel life.

### Compactness

Since a cross roller method is utilized, only two raceway grooves are necessary and presents a very compact package.

Figure A-47 Structure of SER type Slide Guide

### Moment Resistant Type

The wide block design (WA type) has an extremely high moment loading capacity. This will allow for single guide designs in the most demanding and compact applications.

### Tapped Hole Rail Type

For the SER rails, counterbore (standard) and optional tapped hole (N) types are available enabling various installation methods.

### All Stainless Steel Type

The SERS type slide guide is made of all stainless steel components, making it ideal for high temperature, clean room or vacuum applications.

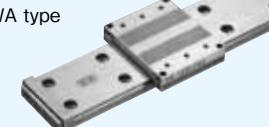

## TYPES

The SER type slide guides are available with a standard block or a wide block (WA) configuration. Each type can be selected with standard rails or counterbore holes or the optional N-Type rails of tapped holes. For anti-corrosion, all stainless steel type is also available with all stainless steel components.

SER-A type

SER-WA type

P.A-46

P.A-48

## ACCURACY

The SER-type slide guides are available with high grade accuracy (blank) or precision grade accuracy (P).

Table A-16 Accuracy

unit/mm

accuracy grade	high	precision
accuracy symbol	blank	P
allowable dimensional difference in height H	$\pm 0.015$	$\pm 0.008$
paired difference for height H	0.015	0.007
allowable dimensional difference in width W	$\pm 0.020$	$\pm 0.010$
paired difference for width W	0.020	0.010
Running parallelism of surface C to surface A	refer to Figure A-48,49	
Running parallelism of surface D to surface B		

Figure A-48 Accuracy

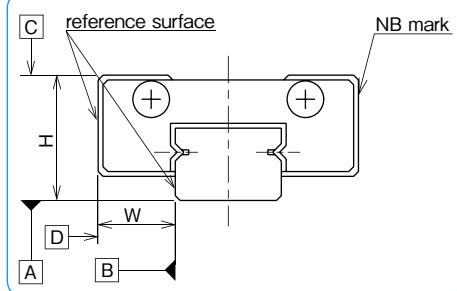

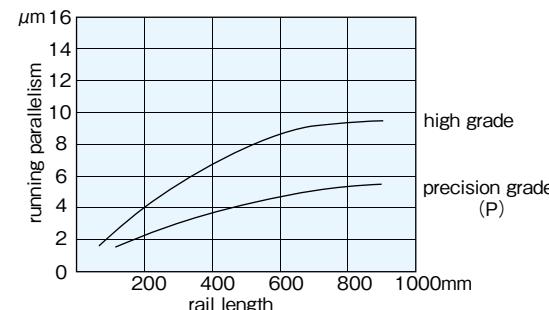

Figure A-49 Motion Accuracy

## PRELOAD

The SER(S) type slide guides are available only with a standard (0 to minimal preload) preload.

## RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the ranges listed in Tables A-17 and A-18, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm)  
N: distance from the end of the rail to the first hole center (mm)  
P: hole pitch (mm) M: number of pitches

Table A-17 N Dimension (standard type) unit/mm

SER12WA	SERS12WA	5	25 470
SER15WA	SERS15WA		670

## MOUNTING

### Mounting Surface Profile

Slide guides are mounted by pushing the reference surface of the rail and the block against the shoulder provided on the mounting surface. An undercut or a radius corner should be provided at the corner of the shoulder, as shown in Figures A-51 and A-52, to prevent interference. The recommended shoulder height and corner radius are shown in Table A-19 and Table A-20 respectively.

Figure A-51 Mounting Reference Surface Profile-1

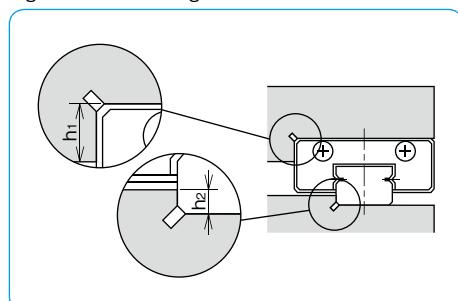

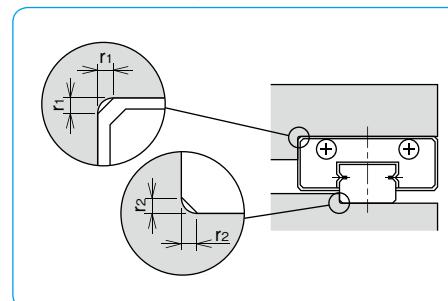

Table A-19 Shoulder Height Dimensions unit/mm

part number	shoulder height on the block side	shoulder height on the rail side
SER 9A	3	1.5

SER15A	5	3.5
SER20A		5
SER 9WA	3	
SER12WA	4	
SER15WA	5	2.5

Figure A-52 Mounting Reference Surface Profile-2

### Recommended Torque Values

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table A-21. Please adjust the torque depending on the operating conditions.

## MOUNTING SCREW

Small screws for the SER(S) type slide guide are available from NB.

Table A-22 unit/mm

size	pitch	length f	application

Figure A-53 Mounting Screw

## LUBRICATION

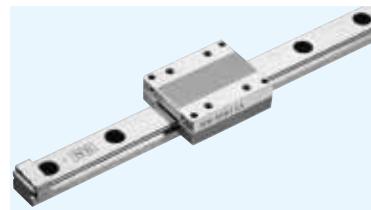

A high grade lithium soap based grease is applied to the NB slide guides prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions. For use in clean rooms or vacuum environments, NB slide guides without grease are available upon request. Please contact NB for customer specified grease types.

Please refer to page Eng-39 for details on the low dust generation grease.

A special syringe lubricant dispenser is available from NB as an option (refer to page Eng-42).

# SLIDE GUIDE SGL TYPE

The NB slide guide SGL type is a linear motion bearing utilizing the rotational motion of ball elements along four rows of raceway grooves. It can be used in various applications due to its compactness and high load capacity.

## STRUCTURE AND ADVANTAGES

The NB slide guide SGL type consists of a rail with 4 rows of precisely machined raceway grooves and a block assembly. The block assembly consists of the main body, ball elements, retainers, and return caps.

### High Load Capacity and Long Life

The use of relatively large ball elements and raceway grooves machined to a radius close to that of the ball elements increases the contact area resulting in a high load capacity and a long travel life.

### Low Friction

Because a 4-row/2-point contact design is used, low friction and stable motion characteristics are achieved even under a preloaded conditions.

### Omni-Directional Load Capacity

The ball elements are positioned at 45° contact angle so that the load capacity is equal in four directions (above, below, right and left).

### Absorption of Mounting Dimensional Error

Because the ball elements are positioned to increase their self-aligning characteristics, the dimensional error caused during installation is absorbed.

### Anti-corrosion Specification

The rail and block assembly can be treated with low temperature black chrome treatment to increase the

corrosion resistance. This treatment is standardized with the symbol "LB". Stainless steel SGLS type is suitable for use in clean room application.

### Dust Prevention

Side-seals are provided as a standard. To improve the dust prevention characteristics, under-seals, double-seals, scrapers, bellows and special rail mounting caps are also available.

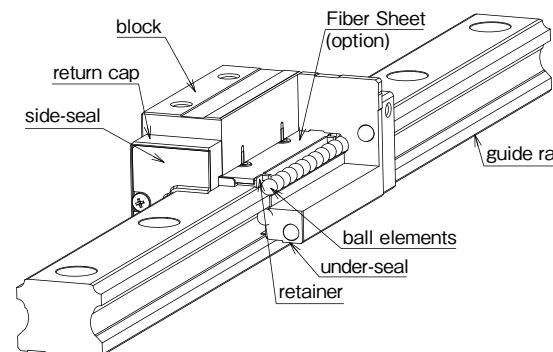

### Fiber Sheet Extends Lubricant Replenishment Intervals

A lubricant-containing Fiber Sheet incorporated in the block supplies appropriate amount of lubricant to the raceway grooves at appropriate intervals, which can significantly extend the lubricant replenishment interval. (refer to page A-16)

### REVERSE-SEAL

NB Reverse-seal realizes maintenance free by reducing grease leakage and loss. (refer to page A-17)

Figure A-54 Structure of SGL type Slide Guide

## BLOCK TYPES

Nine SGL block types are available depending on the material and mounting method.

SGL-F type SGLS-F type	P.A-54 P.A-54	SGL-TF type SGLS-TF type SGL-HTF type SGL-HYF type	P.A-56 P.A-56 P.A-58 P.A-60	SGL-E type	P.A-62	SGL-TE type SGL-HTE type SGL-HYE type SGL-HTEX type	P.A-64 P.A-66 P.A-68 P.A-70

## ACCURACY

Three accuracy grades are available: standard grade (blank), high grade (H), and precision grade (P).

Table A-23 Accuracy

part number	SGL15,20			SGL25,30,35			SGL45			unit/mm

SGL35	- 8~+4	-22~- 8	-35~-22
SGL45	-10~+5	-25~-10	-40~-25

## RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the range listed in Table A-26, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm) M: number of pitches P: hole pitch (mm)  
N: distance from the end of the rail to the first hole center (mm)

Figure A-57 Rail

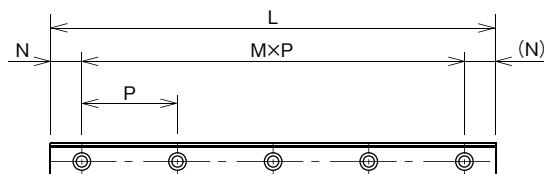

Table A-26 N Dimension unit/mm

part number	N and over	N less than	L max.
SGL15	6	36	2,000

SGL30	12	52	
SGL35	16	56	
SGL45	20	72.5	

Table A-25 Operating Conditions and Preload

preload	symbol	operating conditions
standard	blank	minute vibration is applied. accurate motion is required. moment is applied in a given direction.
	T1	light vibration is applied. light torsional load is applied. moment is applied.
medium	T2	shock and vibration are applied. over-hang load is applied. torsional load is applied.

## MOUNTING

Slide guides are generally mounted by pushing the reference surface of the rail and block against the shoulder of the mounting surface. An undercut should be provided at the corner of the shoulder in order to avoid interference with the corner of the rail or block. The recommended shoulder height values are shown in Table A-28.

The screws to fasten the rail should be tightened equally using a torque wrench in order to secure the motion accuracy. The recommended torque values are listed in Table A-27. Please adjust the torque depending on the operating conditions.

Table A-27 Recommended Torque unit/N·m

size	M3	M4	M5	M6	M8	M12
recommended torque	1.4	3.2	6.6	11.2	27.6	96.4

(for steel alloy screws)

SGL15	4	3.5	0.5
SGL20	5	5	0.5
SGL25	5	5.5	1
SGL30	6	7.5	1
SGL35	6	8	1
SGL45	8	8	1

## GREASE FITTING

A grease fitting is attached to the return cap of SGL type guide blocks for lubrication purposes. Unless otherwise specified, the orientation of the grease fitting is as shown in Figure A-59. When more than 2 blocks are used on one rail, please specify the grease fitting orientation.

Figure A-59 Grease Fitting Orientation

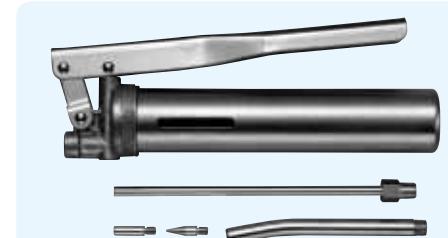

## LUBRICATION

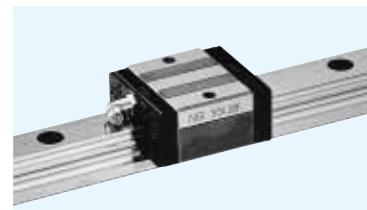

A high grade lithium soap based grease is applied to the NB slide guides prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions. For use in clean rooms or vacuum environments, NB slide guides without grease are available upon request. Please contact NB for customer specified grease types.

Please refer to page Eng-39 for details on the low dust generation grease.

A Grease Gun Set is available as a maintenance kit (refer to page Eng-42).

# SLIDE GUIDE SGW Type

The NB slide guide SGW type is a linear motion bearing utilizing the rotational motion of ball elements along four rows of raceway grooves. Its low height and wide profile makes it suitable for single-rail applications.

## STRUCTURE AND ADVANTAGES

The NB slide guide SGW type consists of a rail with four precisely machined raceway grooves and a block assembly. The block assembly consists of the main body, ball elements, retainers, and return caps.

### High Load Capacity and Long Life

The raceway grooves are machined to a radius close to that of the ball elements. The larger contact area resulting in a high load capacity and a long travel life.

### High Allowable Moment

Its wide profile enables it to sustain high moment loads, making it suitable for single-rail applications.

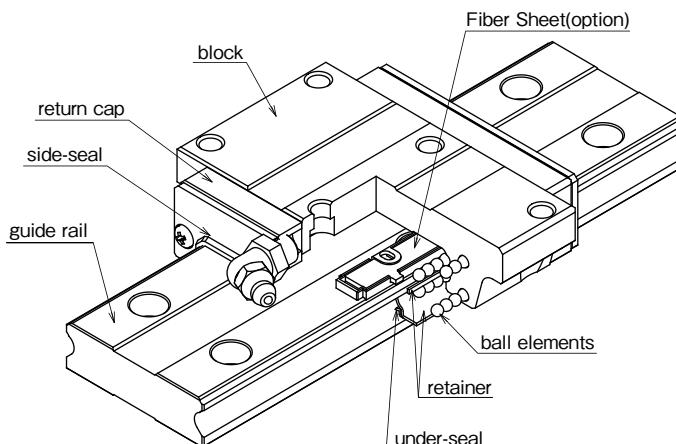

### Omni-Directional Load Capacity

The ball elements are positioned at 45° contact angle so that the load capacity is equal in four directions (above, below, right and left).

### Smooth Motion

The large number of effective ball elements produce a smooth rolling motion.

Figure A-60 Structure of SGW type Slide Guide

### Anti-Corrosion Specification

The rail and block assembly can be treated with low temperature black chrome treatment to increase the corrosion resistance. This treatment is standardized with the symbol "LB", and suitable for use in clean room applications.

### Dust Prevention

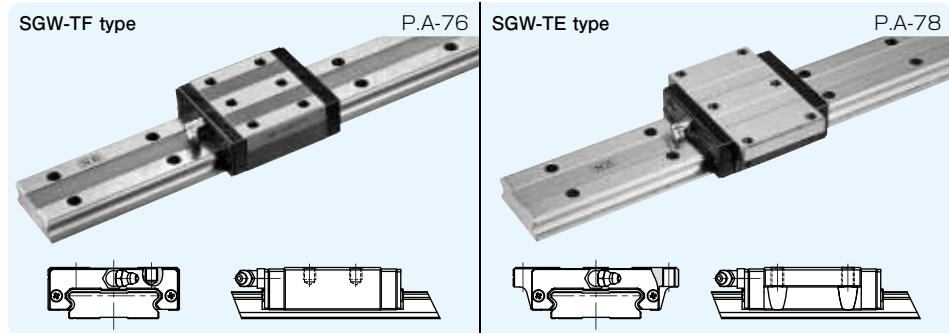

Side-seals are provided as standard. To improve the dust prevention characteristics, under-seals and rail mounting caps are also available.

### Extension of Relubrication Period by Fiber Sheet

A lubricant-containing Fiber Sheet incorporated in the block supplies appropriate amount of lubricant to the raceway grooves, which significantly extends the lubricant replenishment interval. (refer to page A-16)

## BLOCK TYPES

Two SGW block types are available depending on the mounting space and desired mounting method.

## ACCURACY

Three accuracy grades are available: standard grade (blank), high grade (H), and precision grade (P).

Table A-29 Accuracy

unit/mm

part number	SGW17,21			SGW27,35		
	accuracy grade	standard	high	precision	standard	high
accuracy symbol	blank	H	P	blank	H	P
allowable dimensional tolerance for height H	$\pm 0.1$	$\pm 0.03$	$-0.03 \sim 0$	$\pm 0.1$	$\pm 0.04$	$-0.04 \sim 0$
paired difference for height H	0.02	0.01	0.006	0.02	0.015	0.007
allowable dimensional tolerance for width W	$\pm 0.1$	$\pm 0.03$	$-0.03 \sim 0$	$\pm 0.1$	$\pm 0.04$	$-0.04 \sim 0$
paired difference for width W	0.02	0.01	0.006	0.03	0.015	0.007
Running parallelism of surface C to surface A						
Running parallelism of surface D to surface B						

refer to Figure A-61,62

Figure A-61 Motion Accuracy

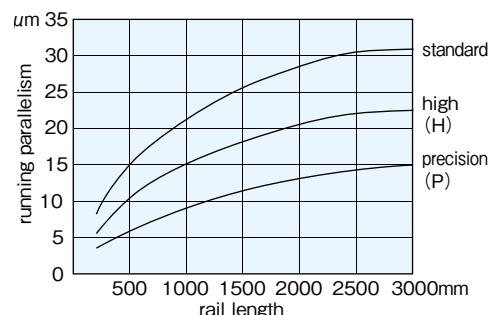

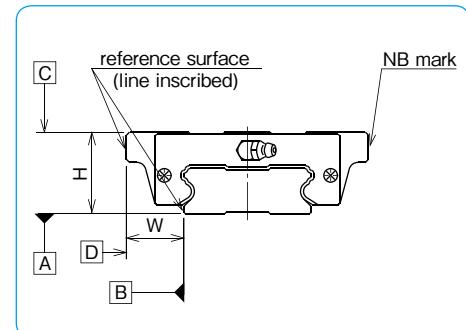

Figure A-62 Accuracy

## PRELOAD

Three levels of preload are available for SGW slide guides: standard (blank), light (T1), and medium (T2).

Table A-30 Preload Call Out and Radial Clearance unit/ $\mu\text{m}$

preload	standard	light	medium
symbol	blank	T1	T2
SGW17	-3~+2	-7~-3	-
SGW21	-4~+2	-8~-4	-
SGW27	-5~+2	-11~-5	-
SGW35	-8~+4	-18~-8	-28~-18

Table A-31 Operating Conditions and Preload

preload	symbol	operating conditions
standard	blank	minute vibration is applied. accurate motion is required. moment is applied in a given direction.
light	T1	light vibration is applied. light torsional load is applied. moment is applied.
medium	T2	shock and vibration are applied. over-hang load is applied. torsional load is applied.

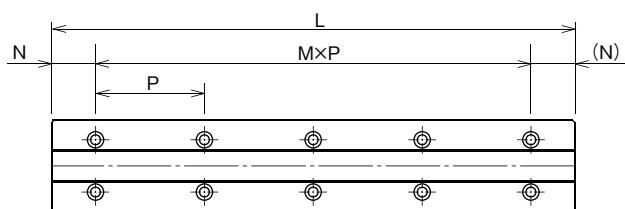

## RAIL LENGTH

Slide guides with most commonly used lengths are available as standard. For slide guides with a non-standard length, unless otherwise specified, the distance from one end of the rail to the first hole center (N) will be within the range listed in Table A-32, satisfying the following equation.

$$L = M \cdot P + 2N$$

L: length (mm) M: number of pitches P: hole pitch (mm)  
N: distance from the end of the rail to the first hole center (mm)

Figure A-63 Rail

## MOUNTING

Slide guides are generally mounted by pushing the reference surface of the rail and block against the shoulder of the mounting surface. To avoid interference between the shoulder and the corner of the rail or block, the recommended dimensions are listed in Table A-34.

The screws to fasten the rail should be tightened to an equal torque using a torque wrench in order to secure the motion accuracy. The recommended torque values are given in Table A-33. Please adjust the torque depending on the operating conditions.

Table A-33 Recommended Torque unit/N·m

size	M4	M6
recommended torque	3.2	11.2

(for alloy steel screw)

part number	h1	h2	r <sub>max</sub>
SGW17	4	2	0.4
SGW21			2.5
SGW27	5		
SGW35		3.5	0.8

## GREASE FITTING

A grease fitting is attached to the return cap of SGW type guide block for lubrication purposes. Unless otherwise specified, the orientation of the grease fitting is as shown in Figure A-65. When more than 2 blocks are used on one rail, please specify the grease fitting orientation.

Figure A-65 Grease Fitting Orientation

BALL SPLINE**

# BALL SPLINE

The NB ball spline is a linear motion mechanism utilizing the rotational motion of ball elements that can sustain loads and at the same time can transfer torque. It can be used in a wide variety of applications including robotics and transport type equipment.

## STRUCTURE AND ADVANTAGES

The NB ball spline consists of a spline shaft with raceway grooves and a spline nut. The spline nut consists of an outer cylinder (main body), retainer, side rings, and ball elements that is designed and manufactured to achieve a reliably smooth motion.

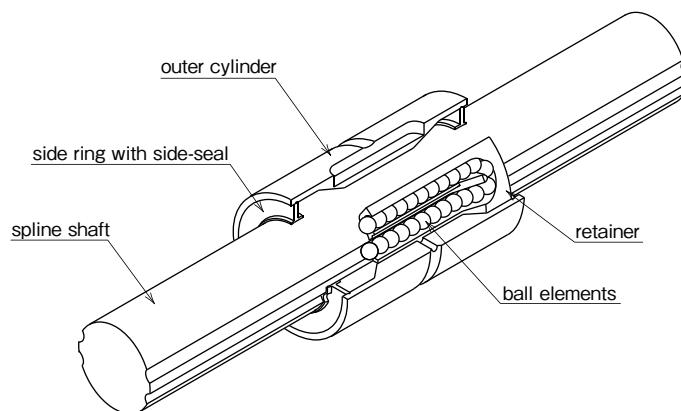

### High Load Capacity and Long Travel Life

The raceway grooves are machined to a radius close to that of the ball elements. The large ball contact area results in high load capacity and long travel life.

### Wide Variety of Configurations

Spline shaft sizes with diameters from 4mm to 100mm are available. Several types of Spline nut are available: cylindrical types (SSP/SSPM), and flange types (SSPF/SSPT). Material option of Stainless steel (SUS440C or equivalent) is also available. They can be specified to suit various applications.

Figure B-1 Basic Structure of NB Ball Spline

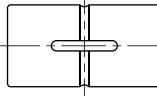

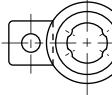

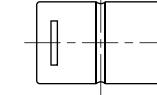

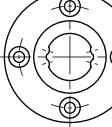

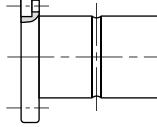

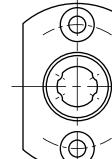

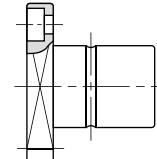

## TYPES

### TYPES OF SPLINE NUT

A wide variety of spline nut designs are available and all spline nuts come with side-seals as a standard feature.

Table B-1 Types of Spline Nut

type of nut	shape and advantage	page
cylindrical type	  <ul style="list-style-type: none"> <li>cylindrical spline nut with key groove</li> <li>with special key</li> <li>nominal diameter: SSP4-100 : SSPS4-25</li> </ul>	P.B-18
	  <ul style="list-style-type: none"> <li>cylindrical spline nut without key groove</li> <li>with two lock plates for fixing</li> <li>nominal diameter: 6-10</li> </ul>	
flange type	  <ul style="list-style-type: none"> <li>spline nut with flange</li> <li>nominal diameter: SSPF6-60 : SSPFS6-25</li> </ul>	P.B-22
	  <ul style="list-style-type: none"> <li>spline nut with a two side cut flange</li> <li>nominal diameter: 6-10</li> </ul>	

## TYPES OF SPLINE SHAFT

Depending on the application requirements, either a ground spline shaft or a non-ground (commercial grade) spline shaft is available.

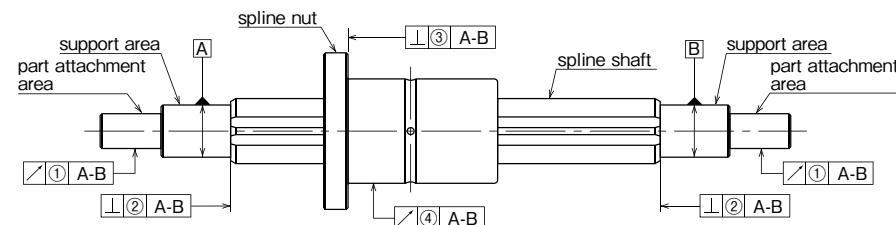

Table B-2

type of spline shaft	shape and advantage
ground spline shaft	 <ul style="list-style-type: none"> <li>precision ground and precision machined surface finish</li> <li>high precision</li> <li>possible to machine ends of spline shaft and surface treatment</li> <li>nominal diameter: 4-100</li> </ul>
standard spline shaft	 <ul style="list-style-type: none"> <li>standard dimension and shape</li> <li>accuracy grade: high grade</li> <li>short lead time</li> <li>nominal diameter: 4-60 (refer to page B-26)</li> </ul>
commercial shaft (non-ground)	 <ul style="list-style-type: none"> <li>for general industrial use</li> <li>cost effective</li> <li>possible to machine ends of spline shaft and surface treatment</li> <li>nominal diameter: 20-50</li> <li>maximum length: 5000mm (refer to page B-27)</li> </ul>

## ACCURACY

The NB ball spline is measured for accuracy at the points shown in Figure B-2 and categorized as either high-grade (blank) or precision-grade (P). Contact NB for accuracy information on the commercial type ball spline.

Figure B-2 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft.

The part attachment area is the portion to which other parts, such as gears are attached.

### Tolerance of Spline Shaft Groove Torsion (Max.)

The groove torsion is indicated per 100mm, arbitrarily set as the effective length of the spline shaft section.

Table B-3  
Tolerance of Spline Shaft Groove Torsion (Max.)

type of shaft	ground shaft	precision (P)
accuracy grade	high	precision (P)
tolerance	13μm/100mm	6μm/100mm

★★ Please contact NB for shaft lengths exceeding 2000mm.

**PRELOAD AND CLEARANCE IN ROTATIONAL DIRECTION**

Both the clearance and preload are expressed in terms of clearance in the rotational direction. The preload is categorized into three different levels: standard, light (T1), and medium (T2). A preload cannot be specified with the commercial grade spline shaft.

Table B-6 Preload and Clearance in Rotational Direction unit/ $\mu\text{m}$

Table B-7 Operating Condition and Preload

preload	preload symbol	operating conditions
standard	blank	minute vibration is applied. a precise motion is required. a torque in a given direction is applied.
light	T1	slight vibration is applied. slight torsional load is applied. cyclic torque is applied.
medium	T2	shock/vibration is applied. over-hang load is applied. torsional load is applied.

**STRENGTH OF SPLINE SHAFT**

The ball spline has larger load ratings compared to ball bush. Also, the ball spline can sustain radial load, moment (bending moment) and torque (twisting moment) at the same time. Thus, it is necessary to consider the strength of ball spline shaft.

Using the following equations, select the size of ball

$$\sigma \geq \frac{M}{Z} \quad \dots \dots \dots (1)$$

$\sigma$ : permissible bending stress of spline shaft( $98\text{N/mm}^2$ )  
M: bending moment onto spline shaft( $\text{N}\cdot\text{mm}$ )  
Z: modulus of section( $\text{mm}^3$ )  
(refer to Table B-8 on page B-8)

**Twisting Moment Only**

$$T_a \geq \frac{T}{Z_p} \quad \dots \dots \dots (2)$$

Ta: permissible twisting stress of spline shaft( $49\text{N/mm}^2$ )  
T: twisting moment onto spline shaft ( $\text{N}\cdot\text{mm}$ )  
Zp: polar modulus of section( $\text{mm}^3$ )  
(refer to Table B-8 on page B-8)

**Bending Moment and Twisting Moment Combined**

Calculate equivalent bending moment ( $M_e$ ) by using equation (3). Then, substitute  $M_e$  into equation (1) for shaft size selection.

$$M_e = \frac{1}{2} \left\{ (M + \sqrt{(M^2 + T^2)}) \right\} \dots \dots \dots (3)$$

$M_e$ : equivalent bending moment ( $\text{N}\cdot\text{mm}$ )  
M: bending moment onto spline shaft  
T: twisting moment onto spline shaft

**Rigidity of Spline Shaft**

The rigidity of spline shaft is expressed in the torsional angle ( $\theta$ ) caused by twisting moment.  
For high accuracy smooth motion, it is necessary to keep the torsional angle within  $0.25^\circ$  per 1,000mm.

$$\theta = \frac{T \cdot L}{G \cdot I_p} \cdot \frac{360}{2\pi} \quad \dots \dots \dots (4)$$

$$\text{Rigidity} = 0.25^\circ \geq \frac{1,000}{L} \theta \quad \dots \dots \dots (5)$$

$\theta$ : torsional angle ( $^\circ$ )  
T: twisting moment onto spline shaft ( $\text{N}\cdot\text{mm}$ )  
L: spline shaft length (mm)  
G: shearing modulus (SUJ2)  $7.9 \times 10^4 (\text{N/mm}^2)$   
(SUS)  $7.69 \times 10^4 (\text{N/mm}^2)$   
 $I_p$ : polar moment of inertia of area ( $\text{mm}^4$ )  
(refer to Table B-8 on page B-8)

## CALCULATION OF DEFLECTION AND DEFLECTION ANGLE OF SPLINE SHAFT

The following formulas are used to obtain the deflection and its angle of the ball spline shaft. Typical conditions are listed in Table B-9.

Table B-9 Formulas for Calculating Deflection and Deflection Angle

support method	specification	formula for deflection	formula for deflection angle
1 support I support		$\delta_{\max} = \frac{P\ell^3}{48EI} = P\ell^3 C$	$i_1 = 0$ $i_2 = \frac{P\ell^2}{16EI} = 3P\ell^2 C$
2 fixed I fixed		$\delta_{\max} = \frac{P\ell^3}{192EI} = \frac{1}{4}P\ell^3 C$	$i_1 = 0$ $i_2 = 0$
3 support I support		$\delta_{\max} = \frac{5p\ell^4}{384EI} = \frac{5}{8}p\ell^4 C$	$i_2 = \frac{p\ell^3}{24EI} = 2p\ell^3 C$

## ALLOWABLE ROTATIONAL SPEED OF SPLINE SHAFT

When the rotational speed is increased and approaches the spline shaft resonant frequency, the spline shaft is disabled from further operation. This speed is called the critical speed and can be obtained by the following equations. In order to leave a sufficient safety margin, the allowable operating speed should be set at about 80% of the calculated value.

Using the following equations, select the size of ball spline shaft. First, calculate  $I_d$  and A by equation (8) and (9) then, substitute the values into equation (7).

$$N_c = 60 \cdot \frac{\lambda^2}{2\pi \cdot L^2} \cdot \sqrt{\frac{E \cdot I_d \cdot 10^3}{\gamma \cdot A}} \quad \dots \dots \dots (7)$$

$N_c$ : critical speed (rpm)

L: support distance (mm)

E: modulus of longitudinal elasticity (SUJ2) $2.06 \times 10^5$  (N/mm<sup>2</sup>)  
(SUS) $2.0 \times 10^5$  (N/mm<sup>2</sup>)

$\gamma$ : density (SUJ2) $7.85 \times 10^{-6}$  (kg/mm<sup>3</sup>)  
(SUS) $7.75 \times 10^{-6}$  (kg/mm<sup>3</sup>)

$I_d$ : Minimum Moment of Inertia of Area (mm<sup>4</sup>)

$$I_d = \frac{\pi \cdot d^4}{64} \quad \dots \dots \dots (8)$$

d: maximum machined-down diameter with no spline grooves left (refer to Table B-10)

A: Minimum Cross-sectional Area of the Spline Shaft (mm<sup>2</sup>)

$$A = \frac{\pi \cdot d^2}{4} \quad \dots \dots \dots (9)$$

d: maximum machined-down diameter with no spline grooves left (refer to Table B-10)

$\lambda$ : coefficient by mounting method  
(refer to Figure B-6)

fixed-free  $\lambda=1.875$

supported-supported  $\lambda=3.142$

fixed-supported  $\lambda=3.927$

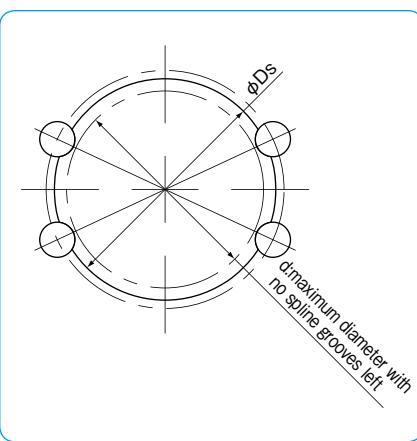

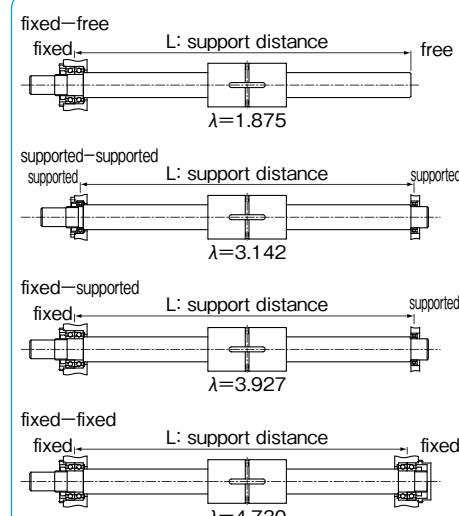

fixed-fixed  $\lambda=4.730$

Table B-10 Spline Shaft Profile

part number	d: maximum diameter with no spline grooves left mm	part number	d: maximum diameter with no spline grooves left mm
SSP 4	3.5	SSP 80	73.9
SSP 6	5.3	SSP 80L

SSP 30A	26.8	SSP 40	33.1
SSP 40A	35.5	SSP 50	41.4
SSP 50A	44.6	SSP 60	49.7
SSP 60A	54		

The maximum diameter (d) is recommended as the shaft diameter of the support area leaving no spline grooves after end-machining.

Figure B-6 Mounting Method

## RATED LIFE

When the ball elements are used as the rolling elements in ball splines, the following equations are used to calculate the life of ball spline.

For radial load

$$L = \left( \frac{f_c}{f_w} \cdot \frac{C}{P} \right)^3 \cdot 50$$

For torque load

$$L = \left( \frac{f_c}{f_w} \cdot \frac{C_T}{T} \right)^3 \cdot 50$$

L: rated life (km) f<sub>c</sub>: contact coefficient f<sub>w</sub>: load coefficient C: basic dynamic load rating (N) P: applied load (N)

C<sub>T</sub>: basic dynamic torque rating (N·m) T: applied torque (N·m)

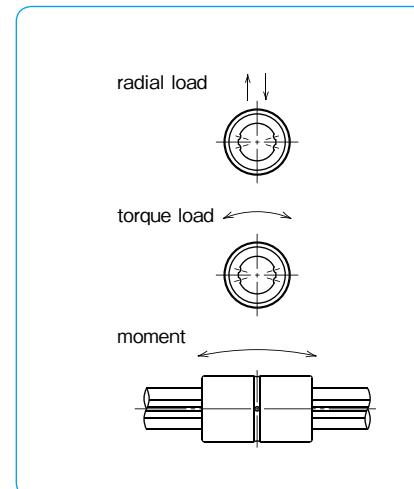

\* Refer to page Eng-5 for the coefficients

\*\* The load rating of the commercial spline is approximately 70% of the standard ball spline.

$$L_h = \frac{L \cdot 10^3}{2 \cdot \ell_s \cdot n_i \cdot 60}$$

L<sub>h</sub>: life time (hr)  $\ell_s$ : stroke length (m)  
L: rated life (km) n<sub>i</sub>: number of cycles per minute (cpm)

Figure B-7 Radial Load and Torque Load

## OPERATING CONDITIONS

The performance of the ball spline is affected by the operating conditions of the application. The operating conditions should therefore be carefully taken into consideration.

### Dust Prevention

Foreign particles or dust in the ball spline nut affects the motion accuracy and shortens the life time. Standard seals will perform well for dust prevention under normal operating conditions, however, in a harsh environment it is necessary to attach bellows or protective covers.

(refer to Figure B-8)

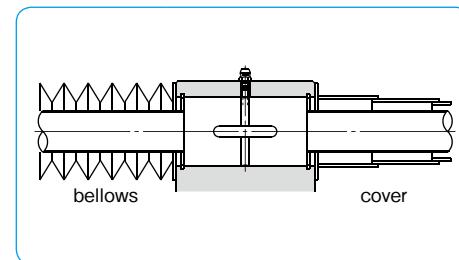

### Operating Temperature

The retainer is made of resin, so the operating temperature should never exceed 80°C.

### Excessive Moment

One spline nut can sustain high moment, however, excessive moment makes the spline nut unbalanced and unstable in motion. Please use more than one spline nut for high moment or high accuracy applications.

Figure B-8 Example of Dust Prevention

## LUBRICATION

The spline nut is prelubricated with lithium soap based grease prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions.

Low dust generation grease is available from NB standard grease. (refer to page Eng-39)

The NB spline nut has seals as standard. The seals work well to contain the grease inside the nut especially for the ground shaft, since the seal shape approximates the spline shaft profile.

## SPECIAL REQUIREMENTS

Based on customer drawings and requirements NB does shaft-end machining, spline nut machining, surface treatment, etc. Please contact NB for special requirements. Table B-11 shows a list of recommended inner diameters for hollow spline shaft.

Figure B-10 Example of Shaft-end Machining

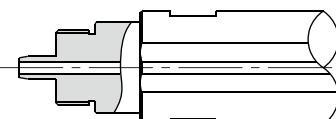

Table B-11

Figure B-9 Example of Lubrication Mechanism

## PRECAUTIONS ON MOUNTING

NB ball spline must be handled with care as a precision component. Please note the following points.

### A Set of Spline Nut and Spline Shaft

The ball spline accuracy and preload is guaranteed when spline nut and shaft are aligned as shown in Figure B-11. Please make sure to align the NB marks when reinserting the shaft.

When inserting the spline shaft into the spline nut, ensure that the ball elements do not drop out. This is done by aligning the raceway grooves of the shaft with the rows of ball elements and the seal lip of the nut. Then carefully insert the spline shaft through the spline nut. In case that the nut is preloaded, please exercise added care.

### Fit between Spline Nut and Housing

A transition fit is used for the SSP/SSPM-type spline nut and its housing bore to minimize the clearance. If high accuracy is not required, then a clearance fit can be used. For the SSPT/SSPF type spline nut, for a light load and little torque application a hole slightly larger than the outer diameter of the nut can suffice. The mounting surface for the flange influences the perpendicularity and parallelism. Please make sure of the accuracy of the mounting surface.

### Insertion of Spline Nut

When inserting a spline nut into the housing, use a jig like the one shown in Figure B-12. Carefully insert the nut so as not to hit the side ring and seal.

Table B-13 Recommended Jig Dimensions unit/mm

- Tolerance of total length and length of splined portion  
total length up to 4,000: JIS B0405 coarse grade  
total length greater than 4,000: ±5.0mm  
Please specify tolerances when required.
- Please refer to dimension tables for nut shape and dimensions.
- When a commercial shaft is used, the load rating of the nut is approximately 70% of indicated rating in the dimension tables.

# ROTARY BALL SPLINE

The NB rotary ball spline can be used for both rotational motion and linear motion. The applications include SCARA robots, the vertical shaft of assembly equipment, tool changers, and loaders, etc.

## STRUCTURE AND ADVANTAGES

The NB Rotary Ball Spline nut consists of a spline nut and a rotating portion using either cross rollers for SPR or balls for SPB.

### High Accuracy

Ball Splines transfer torque and achieve accurate positioning in the linear direction.

By adding rotating portion, Rotary Ball Splines can achieve accurate positioning in the linear and rotational directions.

### Half the Parts, Reduction in Installation Cost

The Spline nut and rotary bearing are combined in order to reduce the number of parts greatly, compared to the one for conventional system.

The combination also reduces the housing thickness to a minimum, resulting in light weight and easy installation.

Figure B-24 Structure of SPR type

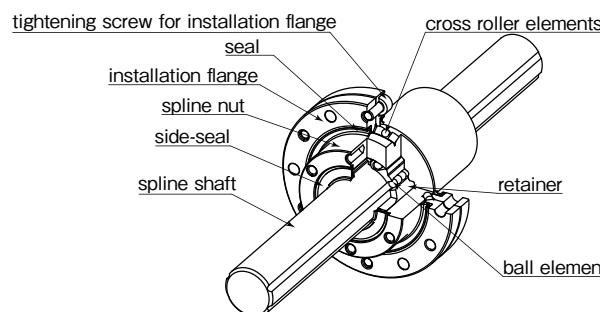

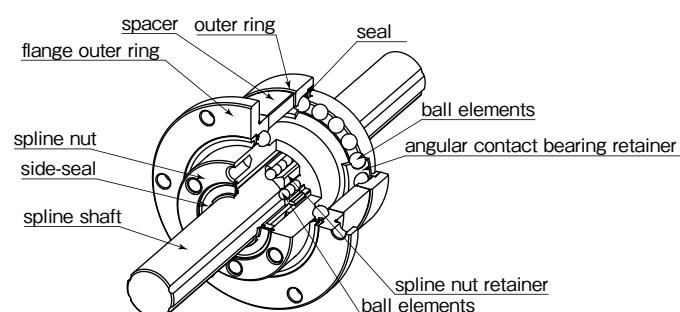

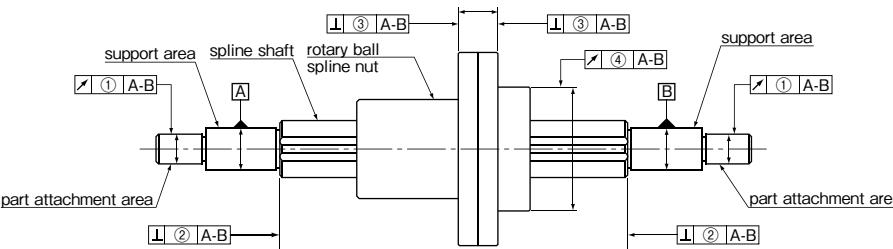

Figure B-25 Structure of SPB type

## ACCURACY OF SPR TYPE

The accuracy of SPR type is measured at the points shown in Figure B-26.

Figure B-26 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft.  
The part attachment area is the portion to which other parts, such as gears are attached.

### Tolerance of Spline Shaft Groove Torsion (Max.)

The groove torsion is indicated per 100mm, arbitrarily set as the effective length of the spline shaft section.

Table B-17 Tolerance of Spline Shaft Groove Torsion (Max.)

tolerance
13μm/100mm

unit / μm

\*\*Please contact NB for spline shafts exceeding 2000mm.

## PRELOAD AND CLEARANCE

The amount of clearance and preload for the spline portion and the cross roller portion are expressed in terms of the clearance in the rotational direction and the clearance in the radial direction, respectively. Three levels of preload are available: standard, light (T1), and medium (T2).

Table B-24 Preload and Clearance in Rotational and Radial Direction unit/μm

	part number	standard	light (T1)	medium (T2)
linear motion	SPR 6	-2~+1	- 6~-2	-
	SPR 8			
	SPR10			
	SPR13	-3~+1	- 8~-3	-13~- 8
	SPR16

	SPR25A	-4~+2	-12~-4	-20~-12
	SPR30A			
	SPR40A			
	SPR50A	-6~+3	-18~-6	-30~-18
	SPR60A			
rotational motion	SPR20			
	SPR25			
	SPR30			
	SPR40			
	SPR50	-6~+3	-18~-6	-30~-18
	SPR60			

Table B-25 Preload and Clearance in Rotational Direction(Linear Motion) unit/μm

	part number	standard	light (T1)	medium (T2)
standard	SPB16	-3~+1	- 8~-3	-13~- 8
	SPB20			
	SPB25	-4~+2	-12~-4	-20~-12

The preload is properly adjusted by the spacer for the angular contact bearings.

Table B-26 Operating Conditions and Preload

preload	symbol	operating conditions
standard	blank	minute vibration is applied. a precise motion is required.
light	T1	light vibration is applied. light torsional load is applied. cyclic torque is applied.
medium	T2	shock/vibration is applied. over-hang load is applied. torsional load is applied.

## SPECIAL REQUIREMENTS

NB provides customization such as shaft-end machining, spline nut machining, and surface treatment per customer requests. Table B-27 shows a list of recommended inner diameters for hollow spline shaft. Please contact NB for the inner diameter of SPR20~SPR60.

Figure B-28 Examples of Shaft-end Machining

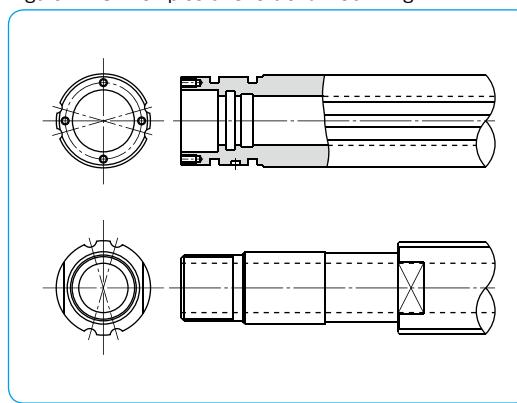

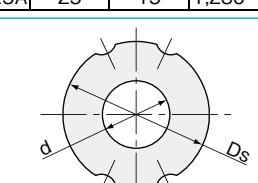

Table B-27 Recommended Inner Diameter for Hollow Spline Shaft

part number	outer diameter Ds mm	inner diameter d mm	cross-sectional coefficient Z mm	second moment of inertia I mm⁴
SPR 6	6	2	19.4	58
SPR 8	8	3	46.5	186
SPR10	10	4	89.6	448
SPR13	13	6	193	1,260
SPR16	16	8	348	2,780
SPR20A	20	10	686	6,860
SPR25A	25	15	1,230	15,400

## MOUNTING

The flange attachment screws of SPR type have been pre-adjusted for smooth rotary movement and should never be loosened. Shock loading to the flange assembly should be avoided as this can degrade the accuracy of movement and deteriorate the overall performance.

The spacer of SPB type is properly adjusted to produce the best preload condition. Shock loading to the spacer should be avoided as this can change the preload condition and deteriorate the accuracy.

### Mounting of Rotary Ball Spline

When the flange of SPR type is to be used with a faucet joint (as shown in Figure B-29) the housing bore should be machined to a tolerance of H7 and to a minimum depth of 60% of the flange thickness. If only a light load is applied to the SPR in operation, the flange can be used without a pilot end.

The housing bore for the SPB type should be machined to a tolerance of H7 and keep the enough depth so that the outer ring is inside the housing. If not, the outer ring may drop off.

Please fix the mounting screws diagonally in steps with progressively applying more torque at each step. Please use a torque wrench for a uniform torque. The recommended torque values for medium-hardness steel screws are listed in Table B-28.

### Insertion of Spline Shaft

When inserting the spline shaft into the rotary ball spline nut, ensure that the ball elements do not drop out. This is done by aligning the raceway grooves of the shaft with the rows of ball elements and the seal-lip of the nut. Then carefully insert the spline shaft through the spline nut.

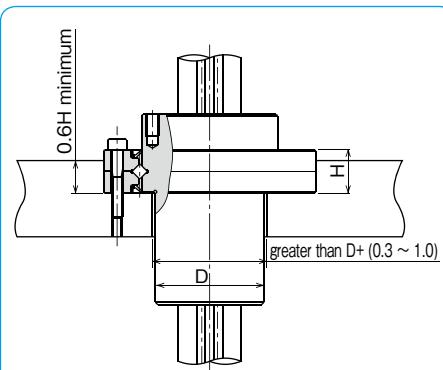

## LUBRICATION

Since NB rotary ball spline nuts are equipped with seals at both the spline portion and the rotational portion, the lubricant is retained for an extended period of time. The spline nut is prelubricated with lithium soap based grease prior to shipment for immediate use. Please relubricate with a similar type of grease periodically depending on the operating conditions.

Low dust generation grease is available from NB standard grease. (refer to page Eng-39)

However, an oil lubricant is recommended for high-speed applications. A grease fitting or machining oil holes is optional (Figure B-30,31), please contact NB for details.

Figure B-29 Flange Mounting Method

	unit / N·m						
mounting screw	M2	M2.5	M3	M4	M5	M6	M8
recommended torque	0.4	0.9	1.4	3.2	6.6	11.2	27.6

(for alloy steel screw)

Figure B-30 Example of Installed Grease Fitting

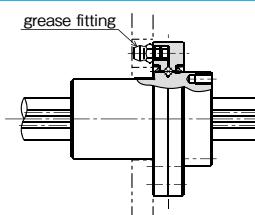

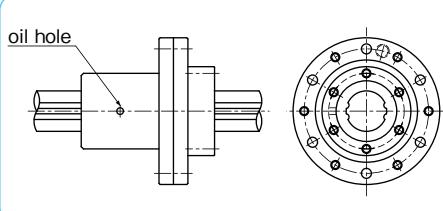

Figure B-31 Oil Hole

## OPERATING CONDITIONS

The performance of the rotary ball spline is affected by the operating conditions of the application. The operating conditions should therefore be carefully taken into consideration.

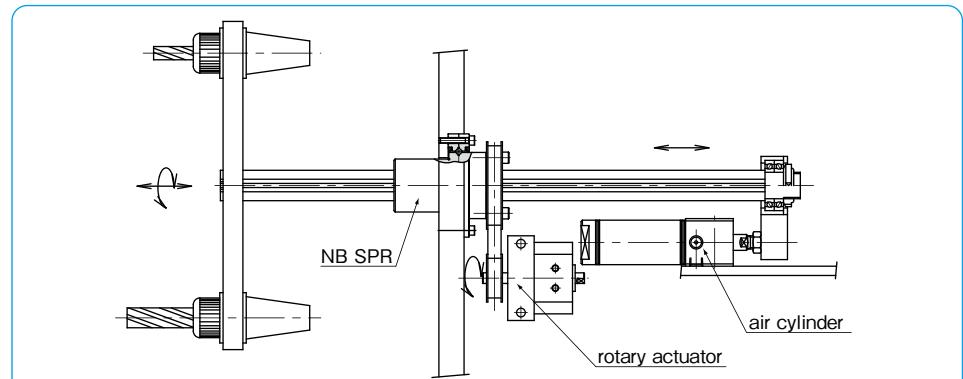

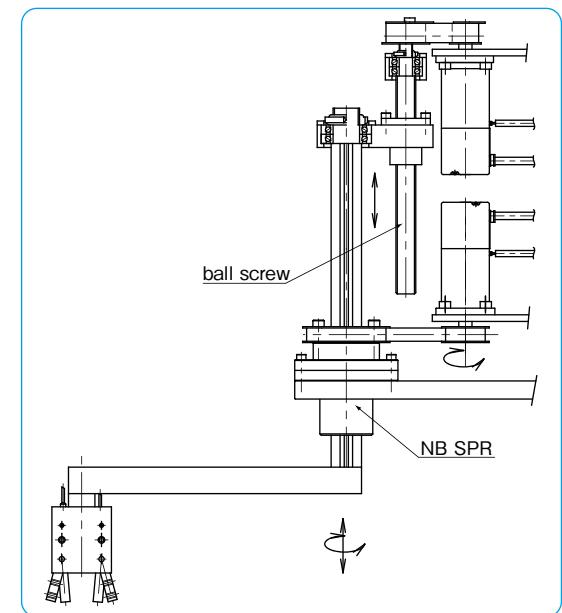

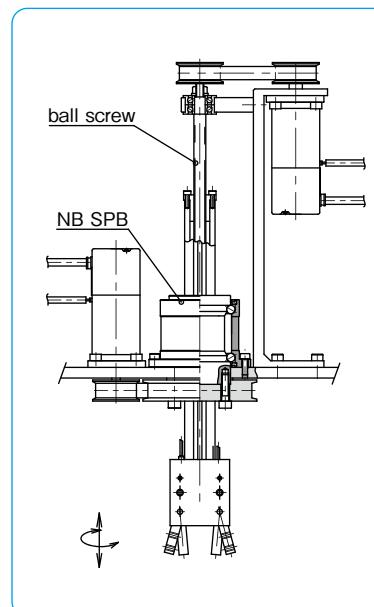

### Operating Temperature

Resin retainers are used in the rotary ball spline, so the operating temperature should never exceed 80°C.

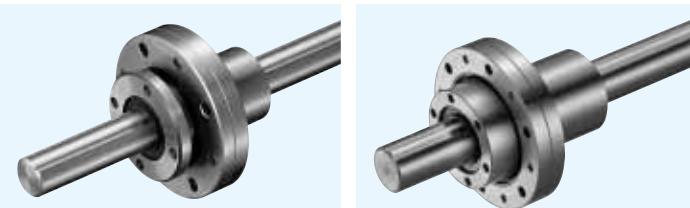

## Dust Prevention

Foreign particles or dust in the rotary ball spline nut affects the motion accuracy and shortens the life time. Standard seals will perform well for dust prevention under normal operating conditions, however, in a harsh environment it is necessary to attach bellows or protective covers.

# STROKE BALL SPLINE

The NB stroke ball spline SPLFS type is a high accuracy linear motion bearing with a limited stroke, to which both radial load and torque can be applied at the same time. It operates with extremely small dynamic friction.

## STRUCTURE AND ADVANTAGES

The NB stroke ball spline consists of a nut and a shaft both with raceway grooves. The flanged spline nut consists of an outer cylinder, a retainer, side-rings, and ball elements.

Since the retainer in the nut is equipped with ball pockets, the ball elements do not contact each other, which allows for a smooth linear motion. The stroke is limited since the retainer is a non-circulating type. For normal operation, it is recommended to consider 80% of the maximum stroke shown in the dimension table as an actual stroke length.

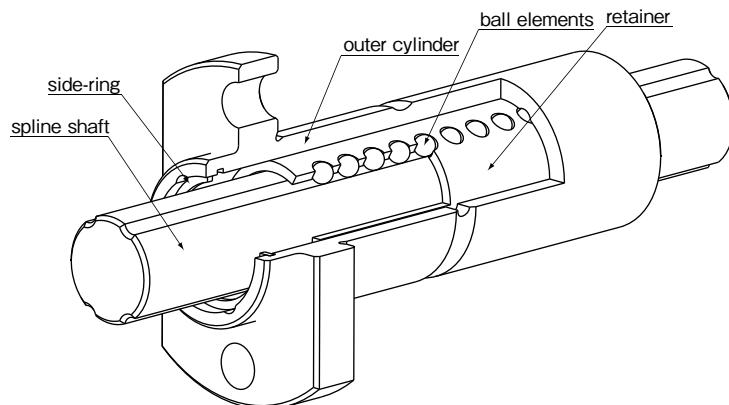

### Extremely Small Dynamic Friction and Low Noise

The rolling elements are separated by the ball pockets so that they do not contact each other. The stroke length is limited, but extremely small dynamic friction and low noise are realized because the rolling elements do not circulate.

### Compact-Size

With the nut about 20% smaller than conventional ball splines, it contributes to space saving.

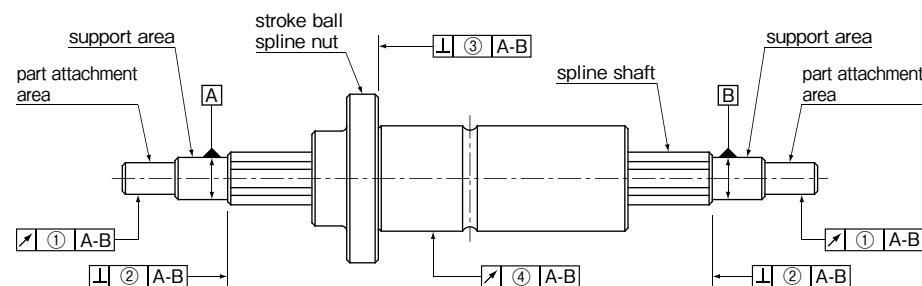

Figure B-32 Structure of SPLFS type

## ACCURACY

The accuracy of the NB stroke ball spline is measured at the points shown in Figure B-33.

Figure B-33 Accuracy Measurement Points

Note: The support area is the portion where, for example, radial bearings are attached in order to support the spline shaft.  
The part attachment area is the portion to which other parts, such as gears are attached.

### Tolerance of Spline Shaft Groove Torsion (Max.)

The groove torsion is indicated per 100mm, arbitrarily set as the effective length of the spline shaft section.

Table B-29 Tolerance of Spline Shaft Groove Torsion (Max.)

\* SPLFS6 maximum shaft length: 400 mm

## PRELOAD AND CLEARANCE

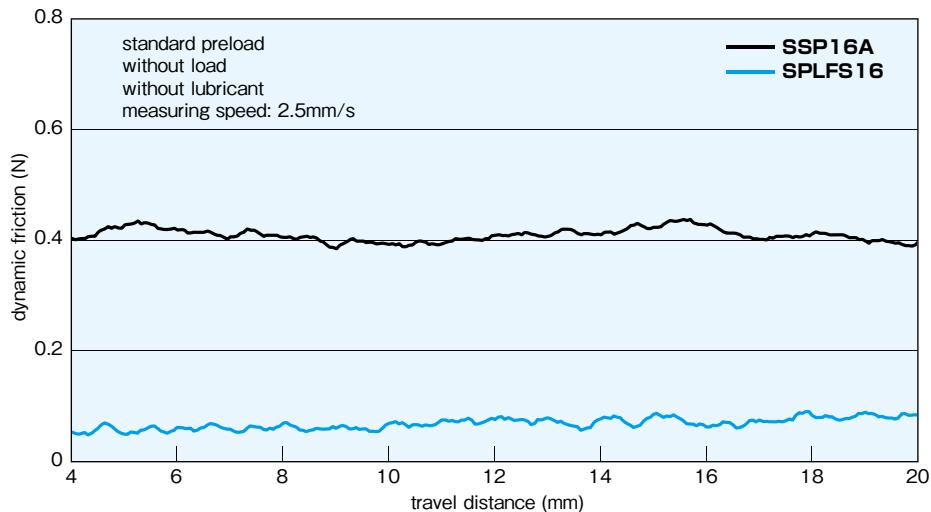

Preload and clearance are expressed in terms of clearance in the rotational direction. For the SPLFS type, only the standard preload is available as shown in Table B-32. Please contact NB if a special preload is required.

Table B-32 Preload and Clearance in Rotational Direction unit/ $\mu\text{m}$

SPLFS13	-4~0
SPLFS16	-4~0

## COMPARISON OF DYNAMIC FRICTIONAL RESISTANCE

Figure B-34 Comparison of Dynamic Friction

## NOTES ON USE

### Dust Prevention

Since the stroke ball spline is designed and manufactured for operation with an extremely small dynamic frictional resistance, seals that increase frictional resistance are not equipped as a standard feature. Please contact NB for a special requirement of seals. For use under harsh conditions, the stroke ball spline should be protected using bellows and protective covers.

### Maximum Stroke

The maximum stroke in the dimension table is the stroke limit.

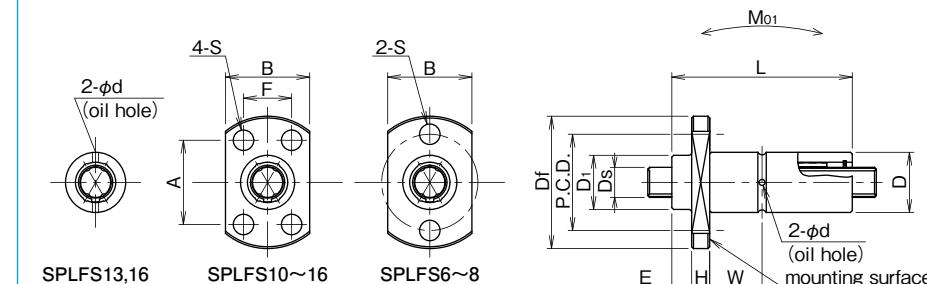

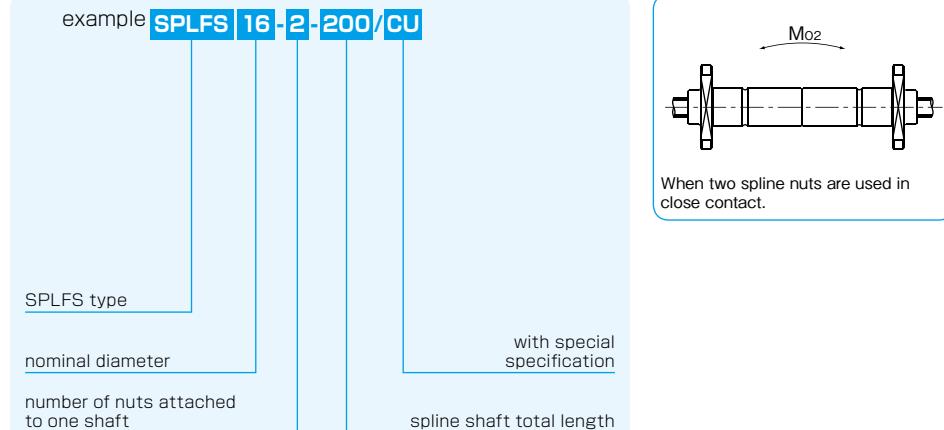

### Retainer Slippage

If the stroke ball spline is used at a high speed or with a vertical shaft, or under an asymmetric load or oscillation, a retainer slippage may occur. For general operation, it is recommended to consider 80% of the maximum stroke length shown in the dimension table as a stroke length.

To prevent the retainer slippage, it is recommended to do a full-stroke movement of the nut whenever necessary in order for the retainer to be relocated to the center.

SLIDE BUSH

# SLIDE BUSH

# SLIDE BUSH

The NB slide bush is a linear motion mechanism utilizing the rotational motion of ball elements. Since linear motion is obtained using a simple mechanism, the slide bush can be used in a wide variety of applications, including transportation equipment, food processing equipment, and semiconductor manufacturing equipment.

## STRUCTURE AND ADVANTAGES

The outer cylinder of slide bush contains a ball retainer that is perfectly designed to control the circulation of ball elements, resulting in smooth linear motion.

### Compact Mechanism

The NB slide bush uses a round shaft for the guiding axis, resulting in space-saving, which allows for compact designs.

### A Wide Variety of Shapes and Installation Methods

The NB slide bush is available in various types, standard, clearance-adjustable, open, flange, etc., for a various applications.

### Selection According to Environment

NB slide bushes are available in standard and anti-corrosion types. Available options include steel-retainer suitable for use in harsh environments and resin retainer for low acoustic, low-cost requirement. Other options can be specified according to the application requirements.

### Compatibility

The NB slide bush is fully compatible with a variety of shaft types.

### Doublelip-Seal

Doublelip-seals reduce the grease leakage, keeping the same function as UU seals which prevent the foreign particles from entering the bush. (see page C-7)

## BLOCK SERIES

### SMA・AK・SMB・SWA Type

This type is the most commonly used standard type. The housing is made of aluminum alloy. The wide(W) type is also available for SMA and AK types.

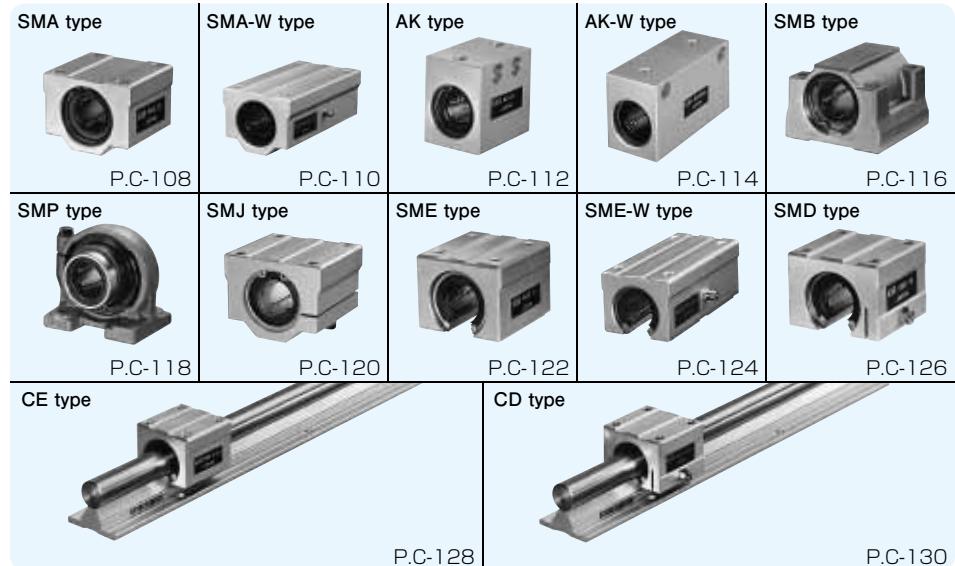

### SMJ・SWJ Type

Clearance-adjustment is achieved by creating a slit on the SMA/SWA type housing. Less clearance between block and shaft results in higher positioning accuracy by tightening the adjustment screw.

### RW Type

The housing is made of ABS resin for light-weight and low-cost. Inside is an inch sized bush of a resin retainer type with seals.

#### Metric Series

#### Inch Series

## SPECIFICATIONS

### Series

The NB slide bush is available in three primary dimensional series, each with different dimensions and tolerances depending on the location of use. Please select the series that is most appropriate for your location.

Table C-5 Series and Use Location

series	location			
	Japan	Asia	Europe	North America
metric	SM	○	○	○
	GM	○	○	○
	KB	○	○	○
inch	SW	○	○	○

○ generally used ○ rarely used

Table C-6 Load Comparison

type	basic dynamic load rating	basic static load rating	allowable static moment
single	1	1	1
long	1.3	1.8	approx. 4
GM-W	1.6	2	approx. 4
SM double	1.6	2	approx. 6
triple	1.6	2	approx. 21

\* The single type is designated as "1" for comparison purposes.

Table C-7 Operating Environment Temperature

outer cylinder	retainer	material	temperature range
		steel	-20°C~110°C
steel	steel	resin	-20°C~ 80°C
	stainless	steel	-20°C~140°C*
stainless	resin	resin	-20°C~ 80°C

\* If a seal is used in the stainless steel slide bush, the temperature is up to 120°C. Please contact NB if a temperature range exceeds 140°C.

Figure C-3 Seal Profile

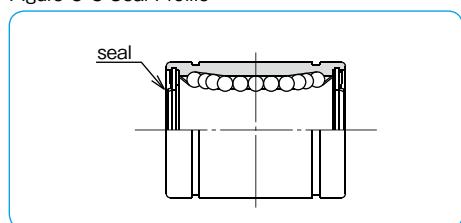

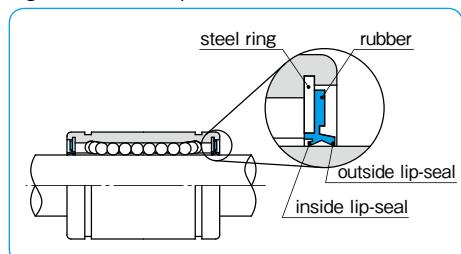

Figure C-4 Doublelip-Seal

## LIFE CALCULATION

Since ball elements are used as the rolling element in the NB slide bush, the following equation is used to calculate the travel life.

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P} \right)^3 \cdot 50$$

L: rated life (km) f<sub>H</sub>: hardness coefficient  
f<sub>T</sub>: temperature coefficient f<sub>C</sub>: contact coefficient  
f<sub>W</sub>: applied load coefficient C: basic dynamic load rating (N)  
P: applied load (N)

\*Refer to page Eng-5 for the coefficients.

## LOAD RATING FOR OPEN TYPE SLIDE BUSH

For the open type slide bush an opening is provided to allow the shaft to be supported from underneath. In case a load is constantly applied in the direction of the opening (for example, being used with a vertical shaft or an overhang loading is applied), the load rating decreases due to less number of loaded rows of ball elements (Table C-8). Therefore, the load rating must be calibrated at the time of design based on the direction of the loading.

Table C-8 Direction of Load and Basic Static Load Rating

part number	SM10G~16G-OP KB10G~16G-OP SW 8G~10G-OP SME (D) 10G~16G CE (D) 16	SM20 (G) -OP KB20 (G) -OP SW12 (G) -OP SME (D) 20 CE (D) 20	SM25 (G) ~100-OP KB25 (G) ~80-OP SW16 (G) ~64-OP SME25~50 SMD25~30 CE (D) 25~30	SM120,150-OP

loading from below				
	0.64C	0.54C	0.57C	0.35C

\* Excluding all the 3-row steel retainer types. Please contact NB in case of 3-row steel retainer.

## MOUNTING

Examples of Mounting methods are shown in Figures C-5 ~8.

Figure C-5 Standard Type

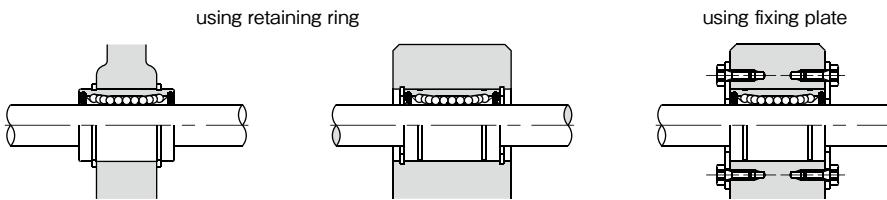

Figure C-6 Clearance Adjustable Type

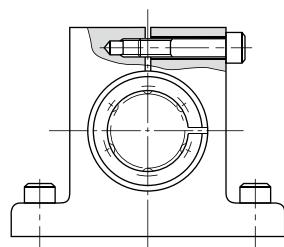

Figure C-7 Open Type

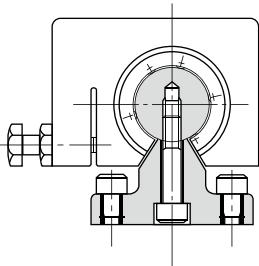

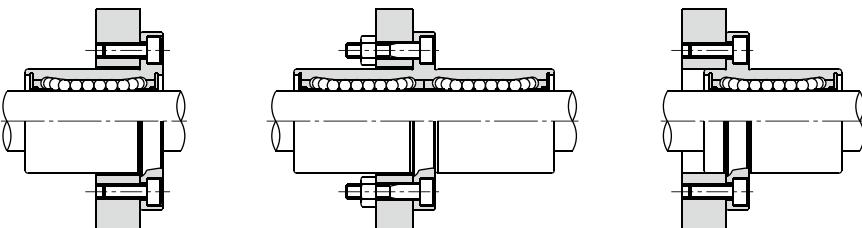

Figure C-8 Flange Type

## Fit

The normal clearance fit listed in Table C-9 is generally selected as a shaft outer diameter tolerance for the NB slide bush. The transition fit is selected for a higher accuracy by reducing clearance between slide bush and shaft. Matching bush and shaft (FIT series) is also available for customer's specified clearance. Please be cautious not to apply excess preloading with clearance adjustable and open types. Please keep pre-loading within the maximum radial clearance listed in the dimension table. The flange-type bush is generally inserted into an installation bore, which is slightly larger than the outer cylinder. However, if the outer cylinder is used as the pilot, H7 tolerance is recommended for housing.

The recommended clearances for the flange type are listed in Table C-10.

Table C-9 Recommended Fit

series	accuracy grade	shaft		housing	
		clearance fit	transition fit	clearance fit	transition fit
SM	high	g6	h6	H7	J7
	precision(P)	g5	h5	H6	J6

SW-W	high	g6	—	H7	—
GM	high	g6	h6	H7	—
GM-W	high	g6	—	H7	—

## Notes on Shaft Selection:

In order to ensure a high accuracy motion of the bush, it is essential to select a high quality shaft.

In selecting a shaft, please take note of:

Hardness: 58HRC or more (refer to hardness coefficient on page Eng-5) recommended

Surface Roughness: less than Ra0.4 recommended

## Notes on Installation

When inserting a slide bush into a housing, carefully insert it by using a jig to apply a uniform pushing force at the end of the outer cylinder, as illustrated in Figure C-9. Motion performance may be diminished if an excessive force is applied to the resin portion of the outer cylinder, the side-ring, or the seal.

Ensure that all burrs are removed from the shaft and carefully install the bush by aligning it with the center of the bore. Excessive force may drop out the ball elements during insertion.

When two or more shafts are used, the parallelism of the shafts will greatly affect the motion characteristics and life of the slide bush. Please check the parallelism by moving the slide bush back and forth the length of stroke to check for freedom of movement before final fixing of the shaft.

Please refer to page F-3 for shaft specifications.

## GM Standard Type

Please avoid a tension load when retaining rings are used for installation.

Table C-10 Recommended Fit (Flange Type)

series	shaft	
	clearance fit	transition fit

SWF-W	g6	—

Figure C-9 Insertion of Slide Bush

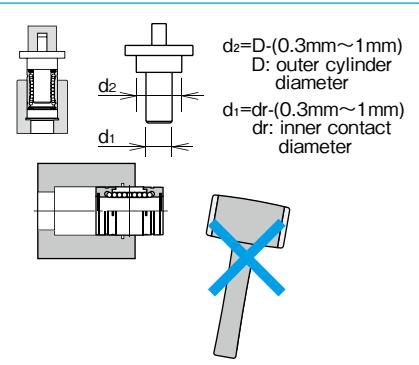

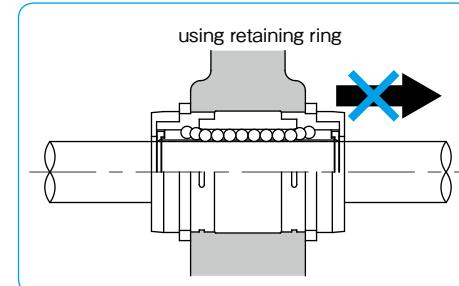

Figure C-10 Installation of GM Standard Type

## LUBRICATION

It is important to lubricate the slide bush for an accurate operation and for a long life. Anti-rust oil is applied to NB slide bush prior to shipment. The NB selected anti-rust oil has a little effect on the lubricant, however, please apply lubricant after cleaning the slide bush by, for example, kerosene, etc.

### Grease Lubricant

Prior to usage, please apply grease, then re-lubricate periodically according to the operating conditions. (Lithium soap-based grease is recommended.) Relubrication can be done by directly applying grease inside the ball bush or by using a grease fitting as Figure C-11 shows.

A special low dust generating grease is optional for clean room application, please refer to page Eng-39.

### Oil Lubricant

Prior to usage, please apply oil directly to the shaft surface or by using an oil hole as Figure C-12 shows. Turbine oil (ISO standard VG32-68) is recommended.

Oil holes can be machined (see Figure C-12) in the center portion of the outer cylinder. Please contact NB for oil hole specification.

Figure C-11 Grease Fitting

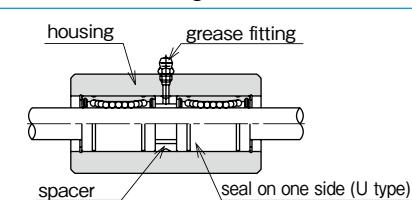

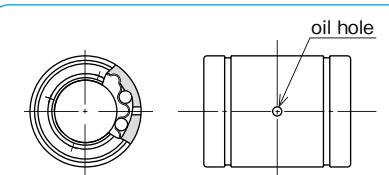

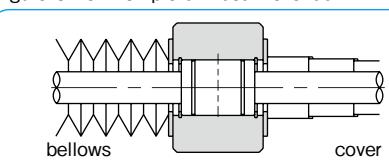

Figure C-12 Oil Hole -Specification-

## DUST PREVENTION

A smooth ball circulation is hindered by dust or foreign particles inside the slide bush. Seals on both sides is a standard option for the NB slide bush, however, in a harsh environment it is necessary to attach bellows or protective covers.

Figure C-13 Example of Dust Prevention

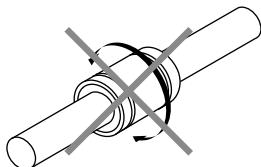

## NOTES ON HANDLING

The NB slide bush is a precision component, please handle with care to maintain its high motion accuracy.

The slide bush is designed for linear motion, so that for applications in which a combination of linear and rotational motion is a requirement, let us recommend Stroke Bush, Slide Rotary Bush, or Rotary Ball Spline.

Figure C-14 Direction of Motion

## OTHER SPECIFICATIONS

### ● Flange Type Slide Bush with Surface-Treatment

The following surface treatments are available as standard option:

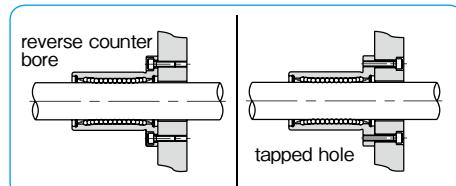

SK	electroless nickel plating
LF	low temperature black chrome treatment with fluoride coating
SB	black oxide (excluding anti-corrosion type)
SC	industrial chrome plating

\* Please contact NB for the thickness of coating and the resulting outer diameter tolerance.

### ● Special Specifications

Please contact NB for more information on surface treatment, oil hole (Figure C-12), flange mounting hole (Figure C-15), etc.

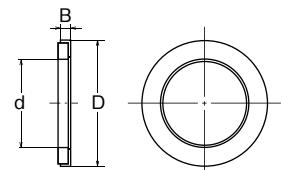

Figure C-15 Examples of Special Installation Hole

## FELT SEAL

A felt seal FLM strengthens lubrication characteristics and extends re-lubrication period of the NB slide bush.

Figure C-16 Felt Seal

FLM100	100 150 10	SM100

### Felt Seal Installation

The felt seal does not work as a retaining ring. Figure C-17 shows how to install the felt seal.

Figure C-17 Example of Felt Seal Installation

## ACCURACY

The accuracy of CE/CD-type support rails are measured as shown in Figure C-18.

Figure C-18 Accuracy Measurement

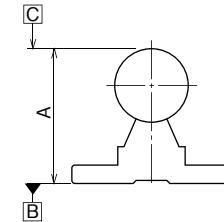

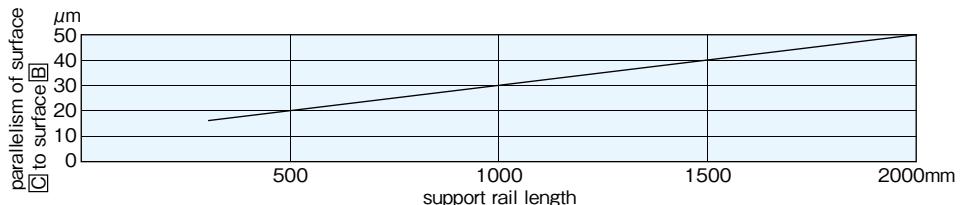

Figure C-19 Accuracy of CE/CD-type Support Rails

## NOTES ON USAGE OF BLOCK SERIES

### Reference Surface

The NB slide units have a reference surface as shown in Figure C-20. Accuracy is achieved by simply pushing the reference surface against the shoulder of the installation surface. (Excluding RBW and SMP types)

### Clearance Adjustment

On the clearance adjustment type please avoid excessive preloading. In the same manner please do not apply excessive torque when tightening the screws.

### Mounting of RBW Type

RBW type has a resin housing. Table C-11 shows proper torque values.

### Recommended Fit

For clearance fit please use a shaft with g6 tolerance and for transition fit a shaft with h6 tolerance. (Excluding adjustable-clearance and open types)

### Special Installation Case of SMJ Type

Special mounting holes will be required for installations such as Figure C-21 shows. Please contact NB for special requirements.

Figure C-20 Reference Surface

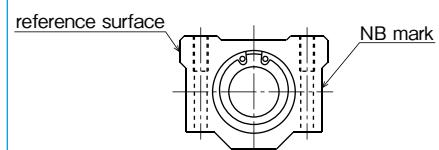

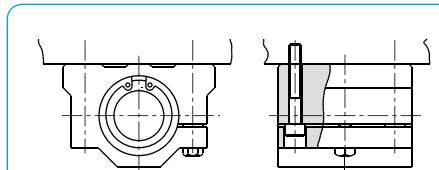

Table C-11 Recommended Torque for RBW Type

part number	mounting screw	torque N·m
RBW8	#6	1.3
RBW10,12	#8	1.9
RBW16	#10	5.2

TOPBALL

**TOPBALL®**

# TOPBALL®

The NB TOPBALL is a linear motion mechanism utilizing the rotational motion of ball elements. NB's self-aligning TOPBALL can be designed into many different applications such as factory automated equipment, machine tools, industrial machines, electrical equipment, optical and measuring instruments.

## STRUCTURE AND ADVANTAGES

### Higher Load Capacity and Longer Travel life

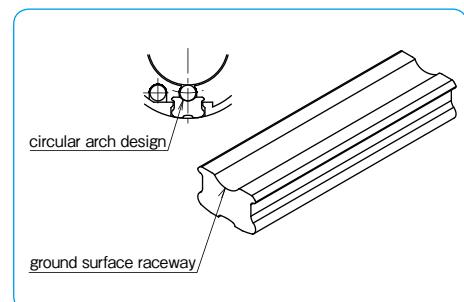

NB's uniquely designed load plate provides circular arch contact to the ball element resulting in a greater dispersion of the load, enabling TOPBALL to provide up to three times the load capacity therefore 27 times the travel life of conventional slide bushings.

### Self Aligning Capability

Load plates are thinner at the ends to provide a pivot point at the center of the plate. The center acts as a fulcrum to compensate for any slight misalignment between the shaft and the housing bore that might be caused by inaccurate machining, mounting errors or shaft deflection.

Straight load plate ST option is available for non self-alignment.

Figure D-1 Circular Arch Design and Ground Surface Raceway

### Floating Seal

NB's unique floating seal design allows for self-alignment while maintaining equal and constant contact to the shaft. Seals do not add to the overall length of the bushing allowing for more compact designs.

### High Speed

TOPBALL meets high speed requirements. The maximum speed is 180m/min.

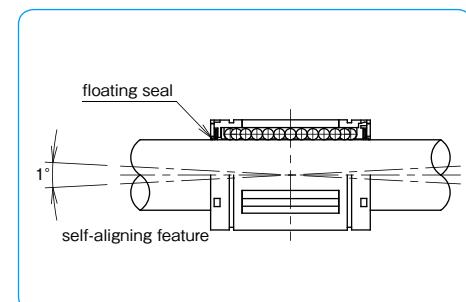

### Clearance Adjustable

TOPBALL load plates are designed to "float" in the outer sleeve which allows for clearance between the ball elements and shaft to best suit application requirements.

### TOPBALL Unit

This is a TOPBALL with a housing. The housing has the most appropriate bore tolerance that optimizes TOPBALL's performance.

Figure D-2 Floating Seal and Self-aligning Feature

## LIFE CALCULATION

Since ball elements are used as the rolling element in the NB TOPBALL, the following equation is used to calculate the rated life.

$$L = \frac{(f_H \cdot f_T \cdot f_C \cdot C)^3}{f_w} \cdot 50$$

L: rated life (km) f<sub>H</sub>: hardness coefficient

f<sub>T</sub>: temperature coefficient f<sub>C</sub>: contact coefficient

f<sub>w</sub>: applied load coefficient (Table D-2)

C: basic dynamic load rating (N) P: applied load (N)

\*Refer to page Eng-5 for the coefficients.

### Applied Load Coefficient (f<sub>w</sub>)

When calculating the applied load, the weight of the mass, inertial force, moment resulting from the motion, and the variation with time should be accurately estimated. However, it is very difficult to accurately estimate the applied load due to the existence of numerous variables, including the start/stop conditions of the reciprocating motion and of the shock/vibration. Estimation is simplified by using the values given in Table D-2.

### Relation Between Ball Circuits and Load Rating

The load rating varies according to the loaded position on the circumference.

The value in the dimension table indicates the lowest load rating with the load placed on top of one ball circuit. Table D-3 shows the load ratio for the TK and TW TOPBALL.

Table D-3 Load Positions

size	TK8	TK10~TK16	TK20~TK50	TW3~TW8	TW10	TW12~TW32
C (dynamic load rating in the table)						
C <sub>MAX</sub> (maximum dynamic load rating)						
load ratio C <sub>MAX</sub> /C   C <sub>MAX</sub> /C	1.414	1.463	1.280	1.414	1.463	1.280
C <sub>Z</sub> (dynamic load rating in reverse direction)	none					
load ratio C <sub>Z</sub> /C   C <sub>Z</sub> /C	—	0.44	0.60	0.70	0.44	0.57

## MOUNTING

### Clearance and Fit

An appropriate clearance between TOPBALL and shaft is required in TOPBALL operation. Inadequate clearance may cause early failure and/or poor, rough movement. Proper clearance is determined by shaft diameter and housing bore. Table D-4 and D-5 show recommended tolerances of the shaft and housing bore.

### Shaft and Housing

To optimize NB TOPBALL performance, high precision shafts and housings are required.

1. Shaft: Dimensional tolerance, surface roughness and hardness greatly affect the traveling performance of the TOPBALL.

The shaft must be manufactured to the following tolerances.

A. Surface roughness of Ra0.4 or less.

B. Hardness of 60 HRC or more (refer to page Eng-5).

C. The proper tolerance of the shaft diameter is recommended on Table D-4 and D-5.

The NB Shaft is an ideal component manufactured to meet these specifications. Please see pages F-1 ~ for details.

If the stroke and number of cycles per unit time are constant, the life time is calculated using the following equation.

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_l \cdot 60}$$

L<sub>h</sub>: life time (hr) l<sub>s</sub>: stroke length (m)

L: rated life (km) n<sub>l</sub>: number of cycles per minute (cpm)

Table D-2 Applied Load Coefficient

operating conditions	applied load coefficient f <sub>w</sub>
no shock/vibration 15 m/min or less	1.0~1.5
low shock/vibration 60 m/min or less	1.5~2.0
high shock/vibration 90 m/min or less	2.0~3.5
high shock/vibration 180 m/min or less	3.5 or more

2. Housing: There are a wide range of designs and manufacturing techniques for housings. NB TOPBALL Units are available as standard products. When housings are prepared separately please refer to Table D-4 and D-5 for a proper fit.

### Mounting

TK type TOPBALL is designed to be press fitted into the housing bore. When inserting bushing, however, don't apply excess force nor shock load which may cause permanent damage. For TW type TOPBALL, examples of mounting are shown in Figures D-3~6 and D-8.

### Examples of Mounting

Figures D-3 to D-8 illustrate mounting methods as example.

Figure D-3 Use of Holding Plates

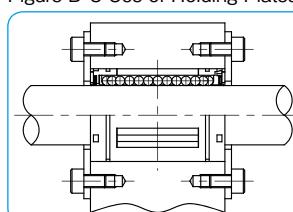

Figure D-4 Clearance Adjustable Type

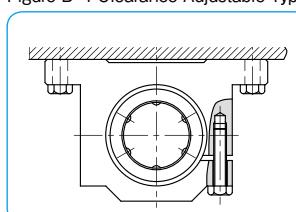

Figure D-5 Use of Retaining Rings

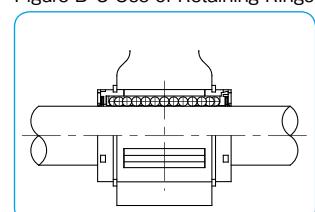

Figure D-6 Open Type

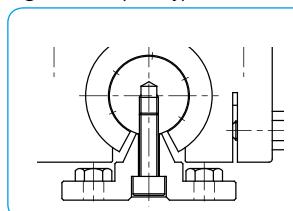

Figure D-7 Press Fit (TK type)

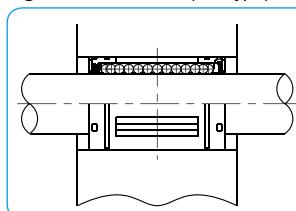

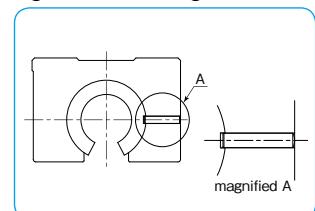

Figure D-8 Pin Fixing

\* Please contact NB for SA type support rails' compatibility with the TOPBALL units.

\* Please fix by the pin for open type housing .

## SPECIFICATION

### Anti-Corrosive Type

A special TOPBALL is also available for anti-corrosive requirements. Please specify with a suffix "-SK" for either TOPBALL or TOPBALL Unit part number. The load plates are electroless nickel plated and balls are made of stainless steel.

# **STROKE BUSH**

---

## **SLIDE ROTARY BUSH**

STROKE BUSH

# STROKE BUSH

The NB stroke bush is a linear and rotational motion mechanism utilizing the rotational motion of ball elements between an outer cylinder and a shaft. It is compact and can withstand high loading.

The retainer is made of a light metal alloy with high wear resistance. Smooth motion is achieved under high-speed and high-acceleration conditions.

Although the linear motion is limited to a specific stroke length, the combined rotation and stroke motion is achieved with very little frictional resistance. The NB stroke bush can be conveniently used in a variety of applications.

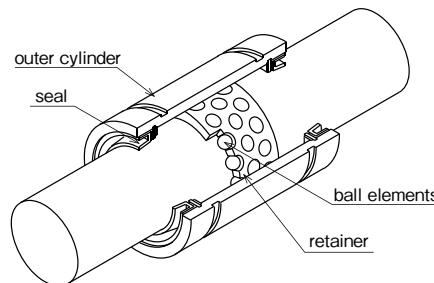

## STRUCTURE AND ADVANTAGES

The retainer in the NB stroke bush positions the ball elements in a zigzag arrangement. The inner surface of the outer cylinder is finished by precision grinding, resulting in smooth motion of the ball elements. Each of the ball elements is held in a separate hole and smooth motion is achieved for both rotational motion and linear motion. The retainer moves half the length of the linear motion; therefore, the stroke length is limited to approximately twice the length the retainer can travel within the outer cylinder.

### High Precision

High-carbon chromium bearing steel is used for the outer cylinder. It is heat treated and ground to achieve high rigidity and accuracy.

Figure E-1 Structure of SR Stroke Bush

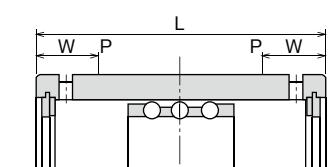

## ACCURACY

The accuracies of the SR stroke bush are stated in the dimension tables. Since the outer cylinder deforms due to tension from the retaining ring, the dimension of the outer cylinder is an average value at points P, where calculated using the following equation:

$$W = 4 + L/8$$

W: the distance from the end of the outer cylinder to measurement point P  
L: the length of the outer cylinder

Figure E-2 Outer Cylinder Measurement Points

## FIT

The fits generally used between the shaft and the housing are listed in Table E-1. The inner contact diameters of the SR stroke bush are listed in the dimension tables. The shaft diameter tolerance should be selected to achieve the desired amount of radial clearance (see Table E-2). Please pay attention that high-speed linear motion can cause the retainer to slip due to inertial force. In selecting a shaft, please take note of:  
Hardness: 58HRC or more (refer to hardness coefficient on page Eng-5) recommended  
Surface Roughness: less than Ra0.4 recommended

Table E-1

normal operating condition		vertical use or highly accurate case	
shaft	housing	shaft	housing
k5,m5	H6,H7	n5,p6	J6,J7

Table E-2 Radial Clearance Negative Limit

part number	limit ( $\mu\text{m}$ )
6	- 2
8~10	- 3
12~16	- 4
20~30	- 5
35~50	- 6
60~80	- 8
100	-10

## RATED LOAD AND RATED LIFE

The relationship between the rated load and life of the stroke bush is expressed as follows:

$$L_h = \frac{(f_H \cdot f_T \cdot f_C \cdot C)^3}{f_w P}$$

L: rated life ( $10^6$  rotations)  
f<sub>H</sub>: hardness coefficient  
f<sub>T</sub>: temperature load coefficient  
f<sub>C</sub>: contact coefficient  
C: basic dynamic load rating (N)  
P: applied load (N)

\*Refer to page Eng-5 for the coefficients.

### For combined rotation and stroke motion

$$L_h = \frac{10^6 \cdot L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2}/dm}$$

### For stroke motion

$$L_h = \frac{10^6 \cdot L}{600 \cdot S \cdot n_1 / (\pi \cdot dm)}$$

L<sub>h</sub>: life time (hr) S: stroke length (mm)  
n: revolutions per min. (rpm)  
n<sub>1</sub>: number of cycles per minute (cpm)  
dm: ball pitch diameter (mm) ≈ 1.15 dr

## ALLOWABLE SPEED FOR COMBINED ROTATION AND STROKE MOTION

The allowable speed for combined rotation and stroke motion is obtained from the following equation:

$$DN \geq dm \cdot n + 10 \cdot S \cdot n_1$$

The value of DN is given as follows depending on the lubrication method.

for oil lubrication	DN=600,000
for grease lubrication	DN=300,000

note.....n≤5,000 S·n<sub>1</sub>≤50,000

## USE AND HANDLING PRECAUTIONS

### Maximum Stroke

The maximum stroke in the dimension table is the stroke limit.

### Retainer Slippage

The retainer can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is suggested that the stroke to be set as a 80% of the maximum stroke in the dimension table. It is also recommended that the bush be cycled to perform the maximum stroke several times, so that the retainer returns to its central position.

# SLIDE ROTARY BUSH SRE SERIES

The NB Slide Rotary Bush SRE Series provides rotary and linear motion functions. Linear motion with unlimited stroke and rotary motion are merged into a single bush resulting in great space saving compared with a combination of any conventional bearings. There are three types; standard, flange, and unit type with sizes ranging from 6 to 40.

## STRUCTURE AND ADVANTAGES

NB Slide Rotary Bush features a special retainer fitted into cylindrical steel outer cylinder and is designed to guide steel balls for smooth circulation in its retainer. The retainer is also designed to rotate freely towards radial direction and offers smooth linear and rotary motions.

### Smooth Operation

The inner surface of the outer cylinder allows smooth operation of linear and rotary motions while maintaining a uniform load distribution.

### High Load Capacity

The use of comparatively large diameter steel balls enhances the load capacity.

### Smooth Rotation

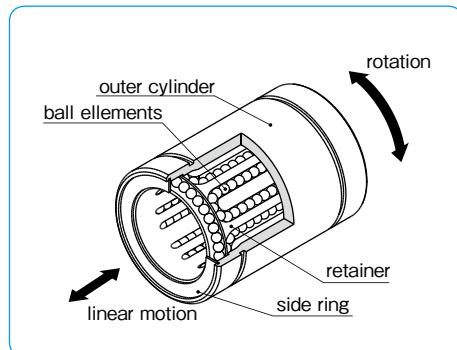

The positioning of the steel balls in a cylindrical formation inside the retainer enables a smooth rotational motion regardless of the installation direction.

### Complete Interchangeability

NB Slide Rotary series is completely interchangeable with SM type Slide Bush, SMK type Flanged Slide Bush and SMA(W) type, AK(W) type and SMP type.

Figure E-3 Structure of Slide Rotary Bush SRE type

## RATED LIFE AND LOAD RATING

The rated life and load rating are defined as follows.

### Rated Life

When a group of slide rotary bearings of the same type are used under the same conditions, the rated life is defined as the total number of rotations made without causing flaking by 90% of the bearings.

### Basic Dynamic Load Rating

The basic dynamic load rating is defined as the load with a constant magnitude and direction at which a rated life of  $10^6$  rotations can be achieved.

### Basic Static Load Rating

The basic static load rating is defined as the load with a constant direction that would result in a certain contact stress at the mid-point of the rolling element and tracking surface that are experiencing the maximum stress.

Equation (1) gives the relation between the applied load and the rated life of the slide rotary bush.

$$L = \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P} \right)^3 \quad \dots \dots \dots (1)$$

L: rated life ( $10^6$  rotations) f<sub>H</sub>: hardness coefficient

f<sub>T</sub>: temperature coefficient f<sub>C</sub>: contact coefficient

f<sub>W</sub>: applied load coefficient C: basic dynamic load rating (N)

P: applied load (N)

\*Refer to page Eng-5 for the coefficients.

Since the slide rotary bush is used in applications with combined linear and rotary motions, the life time is obtained using Equations (2) and (3).

● When linear and rotary motions are combined

$$L_h = \frac{10^6 \cdot L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2}/dm} \quad \dots \dots \dots (2)$$

● When only linear motion is involved

$$L_h = \frac{10^6 \cdot L}{600 \cdot S \cdot n_1 / (\pi \cdot dm)} \quad \dots \dots \dots (3)$$

L<sub>h</sub>: life time (hr) S: stroke length (mm) n: revolutions per minute (rpm) n<sub>1</sub>: number of cycles per minute (cpm) dm: ball pitch diameter (mm) ≈ 1.15dr (dr is the inner contact diameter of the SRE series)

## Calculation Example

The life of SRE20 type NB slide rotary bush is calculated based on the following conditions.

### Conditions

Motion: Linear and rotational combined Load: P=30N Stroke: S=200mm

Revolutions per minute: n=15rpm Number of cycles per minute: n<sub>1</sub>=10cpm

Shaft surface hardness: greater than 58 HRC

Operating temperature: room temperature Other: single shaft with single bush

### Calculation

Basic dynamic load rating: C=647 N

Based on the above conditions, the life is calculated using the following coefficient values.

Hardness coefficient f<sub>H</sub>=1, Temperature coefficient f<sub>T</sub>=1, Contact coefficient f<sub>C</sub>=1

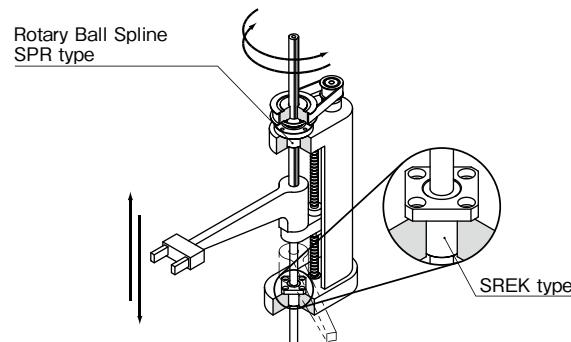

Applied load coefficient, f<sub>W</sub>=1.5

$$\begin{aligned} \text{Rated life } L &= \left( \frac{f_H \cdot f_T \cdot f_C}{f_W} \cdot \frac{C}{P} \right)^3 \\ &= \left( \frac{1 \times 1 \times 1}{1.5} \cdot \frac{647}{30} \right)^3 = 2,972 \text{ (}10^6\text{ rotations)} \end{aligned}$$

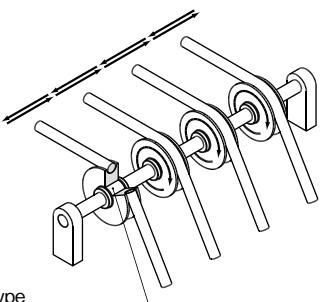

$$\begin{aligned} \text{Life (in hours) } L_h &= \frac{10^6 \cdot L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2}/dm} \\ &= \frac{10^6 \times 2,972}{60\sqrt{(1.15 \times 20 \times 15)^2 + (10 \times 200 \times 10)^2}/(1.15 \times 20)} \\ &= 56,900 \text{ (h)} \end{aligned}$$

## APPLICATION EXAMPLES

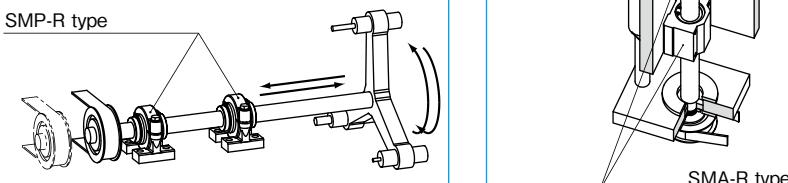

Application Example 1 Vertical Shaft Robot Arm

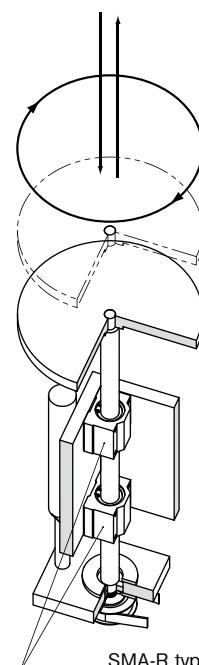

Application Example 2 Multiple Gearing Idler

Application Example 3 Tool Changer

Application Example 4 Turntable

## USE AND HANDLING PRECAUTIONS

### ●Shaft

Since the ball elements rotate on the shaft surface in the SRE type slide rotary bush, the accuracy and hardness of the shaft are important factors.

Outer Diameter: A tolerance of g6 is recommended for smooth operation.

Hardness: A hardness of greater than 58HRC is recommended for long life. If the hardness is less than 58 HRC, the life is calibrated using the hardness coefficient.

Surface Roughness: A roughness of less than Ra0.4 is recommended.

### ●Housing

An inner diameter tolerance of H7 is recommended for housing.

### ●Lubrication

Lubrication is needed (1) to prevent heat fusing by reducing friction between the rolling elements and the tracking surface, (2) to reduce wear of the structural elements, and (3) to prevent rusting.

Lubrication affects both the performance and life of the bush. A lubrication method and a lubrication agent appropriate to the operating conditions should be selected. For oil lubrication, turbine oil (ISO standard VG32-68) is recommended. For grease lubrication, lithium soap based grease No. 2 is recommended. The replenishment interval depends on the operating conditions.

### ●Dust Prevention

Dust and other contaminants affect the bush's lifetime and accuracy. Appropriate prevention methods are thus important.

### ●Operating Temperature Range

The operating temperature is ranging from  $-20^{\circ}\text{C}$  to  $110^{\circ}\text{C}$ . In case of operation at a temperature outside this range, please contact NB.

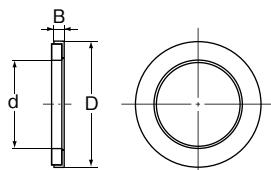

### ●Retainer Material

The standard material of SRE Retainer is copper alloy (stainless steel for size 12). When requiring other material, please contact NB.

## FELT SEAL

A felt seal FLM strengthens lubrication characteristics and extends relubrication period of the slide rotary bush.

Figure E-4 Felt Seal

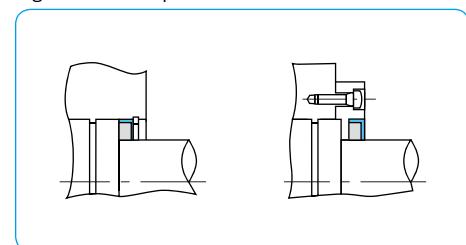

### Installation

The felt seal does not work as a retaining ring. Figure E-5 shows how to install the felt seal.

# SLIDE ROTARY BUSH RK TYPE

NB's RK type slide rotary bush is a highly accurate and high load capacity bearing providing smooth continuous linear and rotational motions. Its structure imposes no constraints on linear and rotational motions. It is much more compact than a standard slide bush with separate rotational bearing.

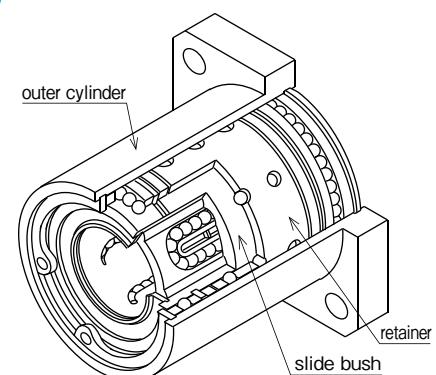

## STRUCTURE AND ADVANTAGES

The RK type slide rotary bush uses a retainer similar to that used in the SR type stroke bush. This retainer gives a smooth motion in a high rotational application.

SM type slide bush is incorporated, providing the stable and smooth linear motion.

Relatively large ball elements are used for high load capacity.

Figure E-6 Structure of RK Slide Rotary Bush

- A smooth unlimited linear and rotational motion is obtained.**
- There is no need to machine separate housing.**
- High accuracy is ensured for extended period of usage.**
- Its high compatibility eliminates replacement problems.**
- High rigidity enables it to withstand an unbalanced load and large load.**

※For best performance, please select tolerance of h5 for the shaft.

### Calculation of Life:

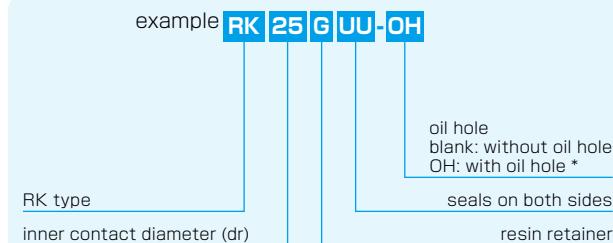

$$L = \left( \frac{f_H \cdot f_T \cdot f_C \cdot C}{f_W} \right)^3 \times 50$$

L: rated life (km) f<sub>H</sub>: hardness coefficient  
f<sub>T</sub>: temperature coefficient f<sub>C</sub>: contact coefficient  
f<sub>W</sub>: applied load coefficient  
C: basic dynamic load rating (N) P: applied load (N)  
※Refer to page Eng-5 for the coefficients.

# SLIDE ROTARY BUSH FR/FRA TYPE

NB Slide Rotary Bush FR type provides combined functions of linear and rotary motion without stroke limitation. Unlike the traditional slide bush, ball elements are arranged around the shaft within the inner space of a bush maintaining compact dimensions while providing high load capacity and high rigidity.

## STRUCTURE AND ADVANTAGES

FR type is supplied as a set of a bush and shaft. Constructed with combination of a load carrying outer cylinder and a return cap, it is designed for smooth compound motions. For ease of mounting, the FRA type is also available, which has the FR bush preinstalled within a factory made housing.

### ●High Load Capacity, High Rigidity

High load capacity, high rigidity, and long life are achieved by ball elements placed all around the inner space between an outer cylinder and a linear shaft.

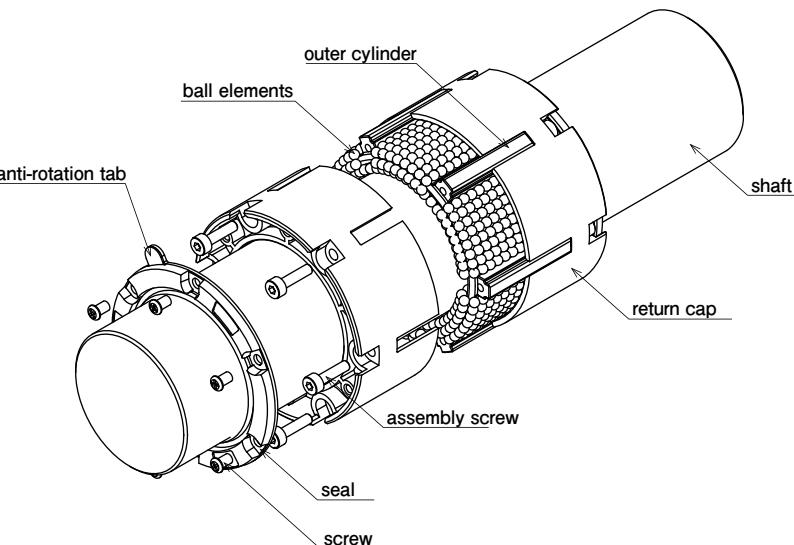

### ●Smooth Motion

Although it is an all-ball bearing construction, load carrying balls are designed to align along the linear direction to provide smooth motion in both linear and rotational directions.

### ●High Accuracy

Each set of a bush and shaft is matched and controlled to ensure smooth and highly accurate motion.

Figure E-7 Structure of FR type

## RATED LIFE AND LOAD RATING

The rated life and load rating are defined as follows.

### ●Rated Life

When a group of slide rotary bushing of the same type are used under the same conditions, the rated life is the number of rotations achieved by 90% of the group without causing flaking.

### ●Basic Dynamic Load Rating

The basic dynamic load rating is the dynamic load with a constant direction and magnitude at which a rated life of 106 rotations can be achieved.

### ●Basic Static Load Rating

The basic static load rating is the static load with a constant direction that would result in a certain contact stress at the mid-point of the ball elements and tracking surface that are experiencing the maximum stress.

Equation (1) gives the relation between the applied load and the rated life of Slide Rotary Bush.

$$L = \left( \frac{f_c}{f_w} \cdot \frac{C}{P} \right)^3 \dots\dots\dots (1)$$

L: rated life (106 rotations) f<sub>c</sub>: contact coefficient (Table E-4) f<sub>w</sub>: applied load coefficient (Table E-5) C: basic dynamic load rating (N) P: applied load (N)

Table E-4 Contact Coefficient

number of linear bearings in close contact on a shaft	contact coefficient f <sub>c</sub>
1	1.00

Table E-5 Applied Load Coefficient

operating conditions loading	applied load coefficient f <sub>w</sub>	
	velocity	15m/min or less
no shock and vibration	40m/min or less	1.0~1.5
low shock and vibration	40m/min or less	1.5~2.0
high shock and vibration	40m/min or less	2.0~3.5

Since the slide rotary bush is used in combined linear and rotary motion, the life time is obtained using Equations (2) and (3).

### ●When linear and rotary motions are combined

$$L_h = \frac{10^6 \cdot L}{60\sqrt{(dm \cdot n)^2 + (10 \cdot S \cdot n_1)^2/dm}} \dots (2)$$

L<sub>h</sub>: life time (hr) S: stroke length (mm) n: revolutions per minute (rpm) n<sub>1</sub>: number of cycles per minute (cpm) dm: ball pitch diameter (mm) = 1.07dr (dr is the inner contact diameter of FR type)

### ●When only linear motion is involved

$$L_h = \frac{10^6 \cdot L}{600 \cdot S \cdot n_1 / (\pi \cdot dm)} \dots\dots\dots (3)$$

## HOUSING

NB Slide Rotary Bush FR type is manufactured with a properly controlled clearance between the shaft and the bush. When designing a custom housing, the recommended tolerance for the housing bore is H7 or H6. When rotational motion is involved anti-rotation tab option (Z) is recommended to prevent the bush from rotating within the housing. Please refer to Table E-6 for the recommended dimensions of housing when using the anti-rotation tab. FRA type is provided with anti-rotation tab as standard feature.

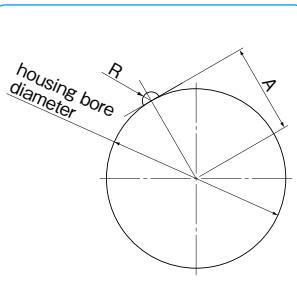

Table E-6

part number	recommended dimensions				
	housing bore diameter		R	A	
	mm	tolerance mm	mm	tolerance mm	mm
FR20	32	+0.025 0	1.75	+0.1 0	16
FR25	40		2.25		20
FR30	45	+0.030 0	2.75	+0.1 0	22.5
FR40	60		4		30
FR50	80		4		40

## USE AND HANDLING PRECAUTIONS

### Ball Drop

FR type is a set of a bush and shaft. Ball elements will drop out if the bush is removed from the shaft since the balls are not retained inside the cylinder. When FR bush must be removed from the shaft, please use a temporary shaft identical to the FR shaft diameter.

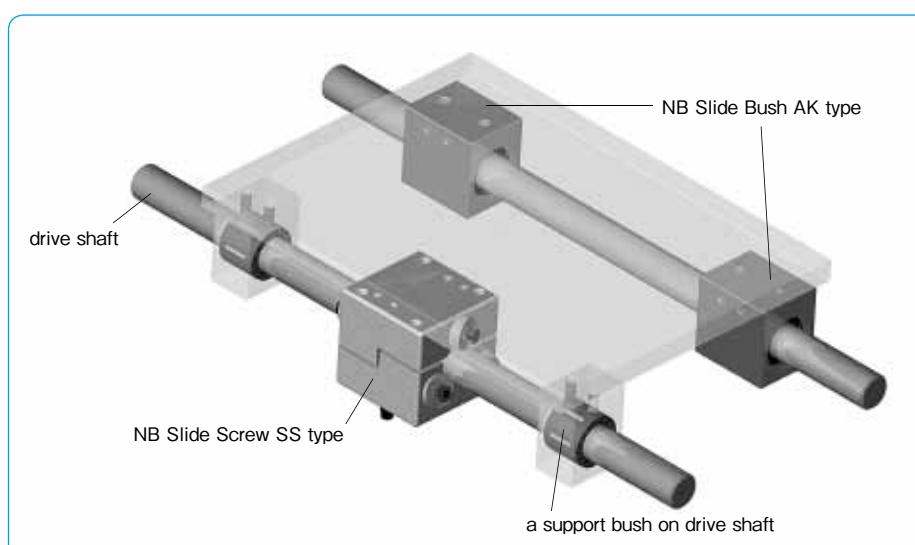

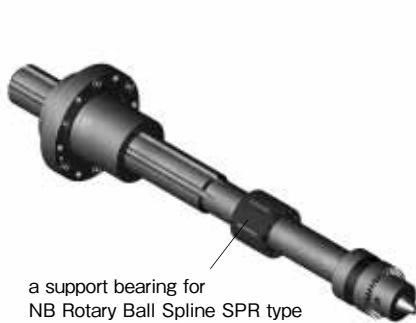

### Lubrication

The purpose of lubrication includes the reduction of friction among the rolling elements as well as between the rolling elements and the raceway, prevention of sintering, reduction of wear, and the prevention of rust. To maximize the performance of FR type, the lubricant type and lubrication method should be selected properly according to the operating conditions. The FR type is pre-lubricated with lithium soap based grease No. 0 for immediate use. Please relubricate with a similar type of grease depending on the operating conditions.

### Operating Temperature Range

FR type's allowable temperature range is from -20 to 80 degrees Celsius.

**SHAFT**

SHAFT

# SHAFT

The NB shaft can be used in a wide range of applications as a mechanical component from straight shaft to spindle shaft. NB's expertise in machining and heat-treatment turns into manufacturing spindle shaft, roll shaft, and general machinery shaft for rotational motion. NB's high accuracy technology answers various shaft machining requirements.

## ADVANTAGES

### Advanced Machining Technology

NB performs a wide variety of highly accurate machining processes to provide custom shafting from relatively simple machining, such as tapping and shaft stepping to the more demanding high-speed rotating shafts and spindles. NB can also answer the special grinding and bore machining requirements.

### Excellent Wear Resistance

Most commonly used materials are high-carbon chromium bearing steel (SUJ2) and martensite stainless steel (SUS440C or equivalent). NB's advanced heat-treatment technology gives these materials an excellent wear resistance by quenching and tempering to achieve a uniform hardened layer in the circumferential and axial directions. The cross-sectional picture below shows the hardened layer-depth of the NB shaft.

Hardened Layer  
(cross section)

### Surface Roughness

Precision grinding results in a surface roughness of less than Ra0.4.

### Wide Selection of Shaft Types

SN type, SNS type, SNT type,  
SNB, SNSB type (Center-lined tapped shaft)  
SNW, SNWS type (Inch shaft)  
SNW-PD, SNWS-PD type (Inch, pre-drilled shaft)  
Spindle shaft, roll shaft

### Special Requirements

Based on the customer drawings and specifications NB will answer the customer requirements in material (SCM, SKS etc.), heat-treatment, surface treatment, etc.

### Shaft Supporter and Shaft Support Rail

These components ease the shaft installation and help save the design/assembling time. (refer to page F-14)

### FIT Series

This series is a set of NB slide bush and NB shaft. By precise shaft-grinding, FIT series achieves the best-fit clearance adjustment for a smooth, high accuracy linear motion. (refer to page F-24)

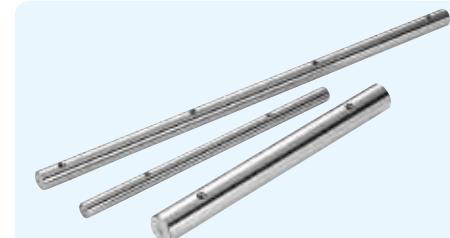

## TYPES

### SN/SNS/SNT type (NB Shaft) SNW/SNWS type (Inch Shaft)

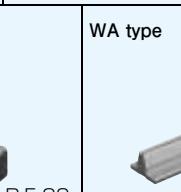

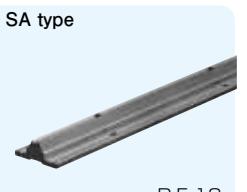

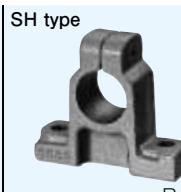

### SNB/SNSB type (NB Center-lined Tapped Shaft)

### SNW-PD/SNWS-PD type (Inch Shaft, Pre-drilled Shaft)

### Shaft Supporter and Shaft Support Rail

### Special Specifications

P.F-26

NB shaft is a high-precision shaft that can be used with slide bush or any other bearings. A wide range of machining is provided for customer drawings and requirements.

### Table F-1 Specifications

type	SN type	SNS type	SNT type
material	SUJ2	equivalent to SUS440C	SUJ2 (hollow shaft)
outer diameter tolerance	g6	or to be specified	
hardness	60HRC or more	56HRC or more	60HRC or more
surface roughness	Ra0.4 or less		
page	page F-6	page F-7	page F-8

Center-lined tapped shafts are standardized series for easy selection that can be used with the SA shaft support rails. (refer to page F-18)

### Table F-2 Specifications

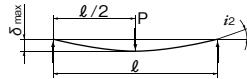

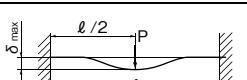

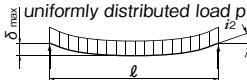

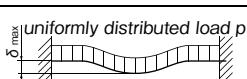

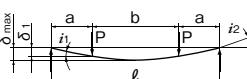

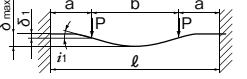

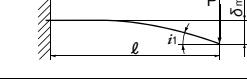

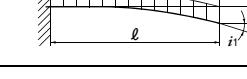

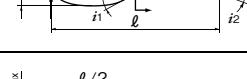

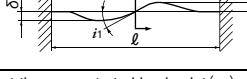

type	SNB type	SNSB type
material	SUJ2	equivalent to SUS440C
outer diameter tolerance	g6	or to be specified
hardness	60HRC or more	56HRC or more
surface roughness	Ra0.4 or less	
page	page F-9	

The SNW and SNWS types are inch dimensional shafts with the same specifications as SN/SNS type (refer to page F-10,11). SNW-PD and SNWS-PD types are standardized series that can be used with the WA shaft support rails. (refer to page F-12,13,22)

## CALCULATION OF DEFLECTION AND DEFLECTION ANGLE

The following formulas are used to obtain the deflection and its angle of the shaft. Typical conditions are listed in Table F-3.

Table F-3 Formulas for Calculating Deflection and Deflection Angle

support method	specification	formula for deflection	formula for deflection angle
1 support   support		$\delta_{\max} = \frac{P\ell^3}{48EI} = P\ell^3C$ $i_1 = 0$ $i_2 = \frac{P\ell^2}{16EI} = 3P\ell^2C$	
2 fixed   fixed		$\delta_{\max} = \frac{P\ell^3}{192EI} = \frac{1}{4}P\ell^3C$ $i_1 = 0$ $i_2 = 0$	
3 support   support		$\delta_{\max} = \frac{5p\ell^4}{384EI} = \frac{5}{8}p\ell^4C$ $i_1 = 0$ $i_2 = \frac{p\ell^3}{24EI} = 2p\ell^3C$	
4 fixed   fixed		$\delta_{\max} = \frac{p\ell^4}{384EI} = \frac{1}{8}p\ell^4C$ $i_1 = 0$ $i_2 = 0$	
5 support   support		$\delta_1 = \frac{Pa^3(2+\frac{3b}{a})}{6EI} = 8Pa^3(2+\frac{3b}{a})C$ $\delta_{\max} = \frac{Pa^3(3\ell^2-a^2)}{24EI} = 2Pa^3(3\ell^2-a^2)C$ $i_1 = \frac{Pab}{2EI} = 24PabC$ $i_2 = \frac{Pa(a+b)}{2EI} = 24Pa(a+b)C$	
6 fixed   fixed		$\delta_1 = \frac{Pa^3(2-\frac{3a}{\ell})}{6EI} = 8Pa^3(2-\frac{3a}{\ell})C$ $\delta_{\max} = \frac{Pa^3(2+\frac{3b}{a})}{24EI} = 2Pa^3(2+\frac{3b}{a})C$ $i_1 = \frac{Pa^2b}{2EI\ell} = \frac{24Pa^2bC}{\ell}$ $i_2 = 0$	
7 fixed   free		$\delta_{\max} = \frac{P\ell^3}{3EI} = 16P\ell^3C$ $i_1 = \frac{P\ell^2}{2EI} = 24P\ell^2C$ $i_2 = 0$	
8 fixed   free		$\delta_{\max} = \frac{p\ell^4}{8EI} = 6p\ell^4C$ $i_1 = \frac{p\ell^3}{6EI} = 8p\ell^3C$ $i_2 = 0$	
9 support   support		$\delta_{\max} = \frac{\sqrt{3}Mo\ell^2}{216EI} = \frac{2\sqrt{3}}{9}Mo\ell^2C$ $i_1 = \frac{Mo\ell}{12EI} = 4Mo\ell C$ $i_2 = \frac{Mo\ell}{24EI} = 2Mo\ell C$	
10 fixed   fixed		$\delta_{\max} = \frac{Mo\ell^2}{216EI} = \frac{2}{9}Mo\ell^2C$ $i_1 = \frac{Mo\ell}{16EI} = 3Mo\ell C$ $i_2 = 0$	

$\delta_1$ : deflection at the concentrated load point (mm)    $\delta_{\max}$ : maximum deflection (mm)    $i_1$ : deflection angle at the concentrated load point (rad)  
 $i_2$ : deflection angle at the support point (rad)    $Mo$ : moment (N · mm)    $P$ : concentrated load (N)  
 $p$ : uniformly distributed load (N/mm)    $a, b$ : concentrated load point distance (mm)    $\ell$ : span (mm)    $I$ : moment of inertia of area (mm<sup>4</sup>)  
 $E$ : modulus of longitudinal elasticity (SUJ2)  $2.06 \times 10^5$  (N/mm<sup>2</sup>)    $SUS(2.0 \times 10^5)$  (N/mm<sup>2</sup>)    $C$ :  $1/48EI$  (1/N · mm<sup>2</sup>)

The moment of inertia of area ( $I$ ) is obtained using the following formulas:

● For solid shaft

$$I = \frac{\pi D^4}{64}$$

$$I = \frac{\pi}{64}(D^4 - d^4)$$

$I$ : moment of inertia of area (mm<sup>4</sup>)  
 $D$ : outer diameter (mm)    $d$ : inner diameter (mm)

The values of the moment of inertia of area and  $C$  ( $=1/48 EI$ ) for NB shafts are listed in Table F-4 and F-5.

### Calculation Examples

1. Calculating the maximum deflection of a 30mm shaft with a 500mm span when a concentrated load of 980 N is applied at the mid-point of the shaft ... (neglecting the shaft weight)

① In case the support method is support-support:

From the given conditions,  $P = 980$  N,  $\ell = 500$  mm  
 From Table F-4,  $C$  for an outer diameter of 30 mm,  
 $C = 2.54 \times 10^{-12}$  (N · mm<sup>2</sup>).

Substituting these values into the corresponding formula (No. 1) in Table F-3,  
 $\delta_{\max} = P\ell^3C = 0.31$  (mm)

② In case the support method is fixed-fixed:

Substituting the values into the corresponding formula (No. 2) given in Table F-3,

$$\delta_{\max} = \frac{1}{4}P\ell^3C = 0.08 \text{ (mm)}$$

2. Calculating the maximum deflection of a 60mm shaft with an inner diameter of 32 mm and a 2,000 mm span by its own weight ...

From Table F-5,  $C$  for an outer diameter of 60 mm,  
 $C = 1.73 \times 10^{-13}$  (N · mm<sup>2</sup>)

The mass per unit length of a shaft with an outer diameter of 60 mm and an inner diameter of 32 mm is 15.9kg/m. Therefore, a uniformly distributed load of 0.156 N/mm is applied. Substituting these values into the formula (No. 3) given in Table F-3.

$$\delta_{\max} = \frac{5}{8}p\ell^4C = 0.27 \text{ (mm)}$$

Table F-4 Solid Shaft

material: high-carbon chromium bearing steel (SUJ2)

hardness: 60HRC (HV697) or more

Tolerances other than g6 are available upon request.

## NB CENTER-LINED TAPPED SHAFT

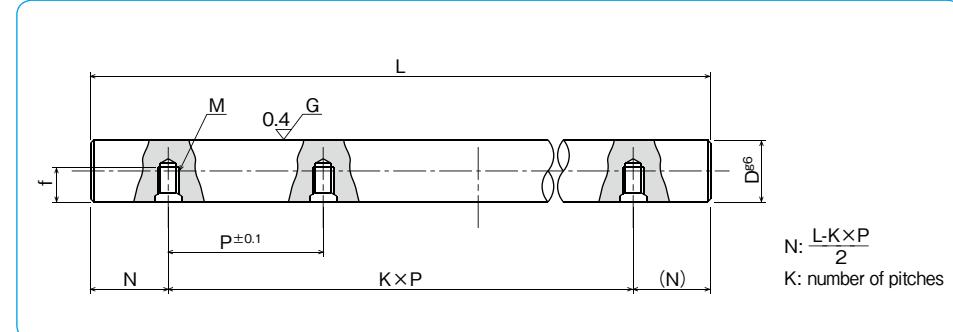

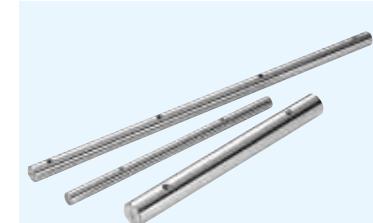

A larger diameter shaft can overcome problems in maintaining precision functionality when a high or unbalanced load is applied. A combination of the center-lined tapped shaft together with the SA type support rail is ideal in such cases. (see pages F-18,19) The center-lined tapped shaft is standardized to simplify shaft selection.

## SHAFT SUPPORTER AND SHAFT SUPPORT RAIL

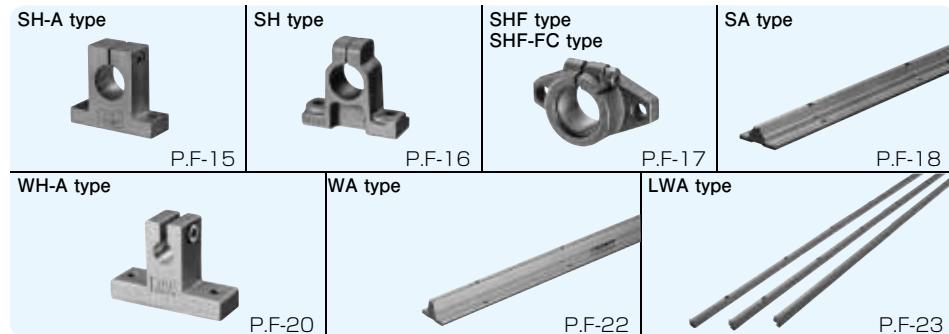

These components save design/assembling time and ease shaft installation.

### SH・SH-A・WH-A type

These are most commonly used compact shaft supporters. SH type is made of cast iron and SH-A/WH-A type is made of aluminum alloy.

### SHF・SHF-FC type

These are flanged type shaft supporters for a compact design. SHF is made of aluminum alloy and SHF-FC (shaft diameter 35 and over) is made of cast iron.

## ACCURACY

The accuracy of the SA support rails are measured as shown in Figure F-1.

Figure F-1 Measurement Method

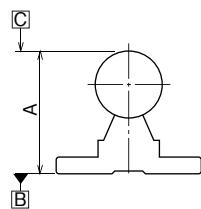

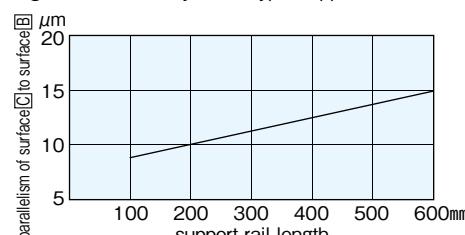

Figure F-2 Accuracy of SA type Support Rail

## FIT SERIES

Due to the combined tolerances of the bush's bore and the shaft's diameter, accuracy can be affected by clearance or increased dynamic friction caused by preloading.  
NB's FIT Series takes advantages of the lower cost slide bush and the precision ground shaft to achieve a target clearance in order for the linear system to produce a smooth, high-accuracy performance.

### part number structure

- Please refer to corresponding catalog pages for details.
- Please specify on the drawing about the shaft machining, radial clearance, match-marking, etc.

### Recommended Radial Clearance

Depending on the type of application, the clearance range varies, please use the chart below as a guideline.

target	clearance (+)	← 0 →	clearance (-)
light motion		0	
high accuracy		0	-40 μm
no play		0	-100 μm

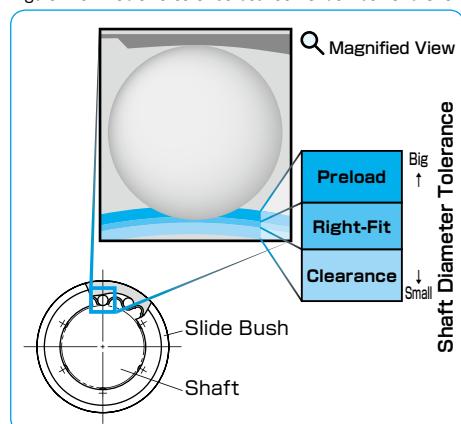

### Slide Bush, Radial Clearance (-), Negative Limit

Negative clearance is opted to reduce backlash. Please refer to the chart below for the negative clearance limits.

size	3~8	10~13	16~25	30~35	40	50~60
radial clearance limit	-3 μm	-4 μm	-6 μm	-8 μm	-10 μm	-13 μm

- The off-center of the housing causes uneven loading on the slide bush, please pay special attention to the centering of the housing especially when negative clearance is a requirement.
- Please contact NB for details on the extra preloading requirement or on other part numbers like SRE, SR, etc.

Figure F-3 Radial Clearance between Slide Bush and Shaft

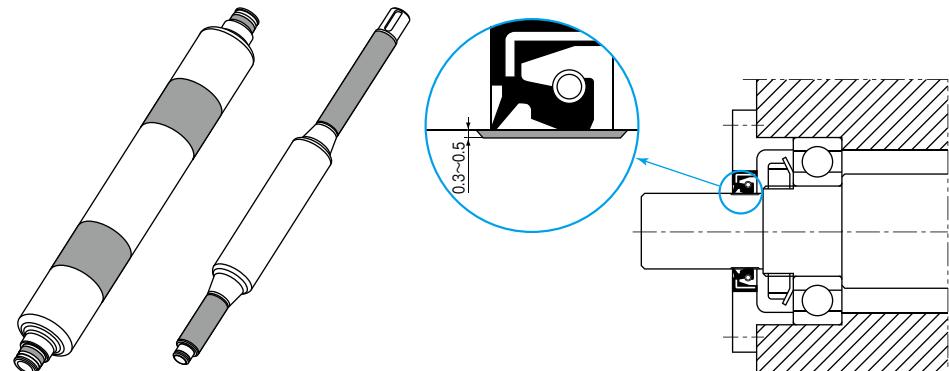

## THERMAL-SPRAYING CERAMIC-COATING SPECIFICATIONS

### ADVANTAGES

Parts that require wear and corrosion resistance can be thermal-sprayed with a ceramic material per NB's ceramic-coating specifications. Ceramic-coating can be applied to a wide variety of materials. The pores in the coated layer result in good lubrication characteristics and can be sealed to achieve high corrosion resistance.

### APPLICATION EXAMPLE

Application of a ceramic coating to oil-sealing parts, rollers, and roll shafts results in good lubrication and high wear/corrosion resistance characteristics.

Note: Ceramic coated surface cannot be used as the inner race for a slide bush.

### REFERENCE

#### Standard Coating Materials

High-carbon chromium bearing steel (SUJ2)	Martensite stainless steel (equivalent to SUS440C)
Chrome molybdenum steel (SCM415, 435)	Austenite stainless steel (SUS303, 304)
Carbon steel for machinery (S45C)	Tool steel (SKS3, SK4)

Proper heat treatment can be done on your request. Thermal-spraying ceramic-coating is applicable to other materials as well.

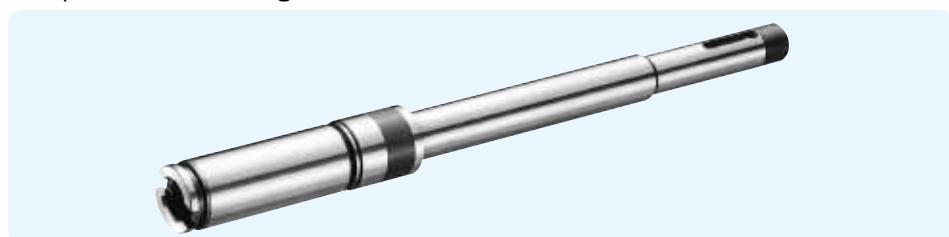

#### Standard Ceramic for Thermal-Spraying

main component	specific gravity	hardness	characteristics
TiO <sub>2</sub> titanium dioxide	4.7	58HRC	max. temp. 540°C color: black wear resistant fine coating fine surface finish

thermal-spraying layer thickness: 0.3-0.5mm

Other types of ceramic materials can be thermal-sprayed. Contact NB for more information.

#### Example of Ceramic Coating

## RANGE AND SPECIFICATIONS OF MACHINING

NB does shaft-machining based on the customer requirements.

### Range Of Machining

maximum diameter	650mm
maximum length	6000mm
surface roughness	Ra0.4 or less

straightness	customer specification
concentricity	customer specification
squareness	customer specification
cylindricity	customer specification

### Internal Surface Grinding

The straight/tapered portion of the inner spindle can be ground.

### Deep Hole Machining

hole diameter	maximum length of hole	
	non through hole	through hole
$\phi 2 \sim 2.5\text{mm}$	200	400
$\phi 3 \sim 3.5\text{mm}$	300	600
$\phi 4 \sim 8\text{mm}$	500	1000
$\phi 9 \sim 10\text{mm}$	750	1500
$\phi 10 \sim 32\text{mm}$	850	1700
$\phi 30 \sim 80\text{mm}$	2000	4000

### Screw Grinding

Triangular and trapezoidal threading can be handled.

### Compatible Parts

Special nuts compatible with a given shaft can be machined. The inner surface and outer diameter of the tapered portion can be ground.

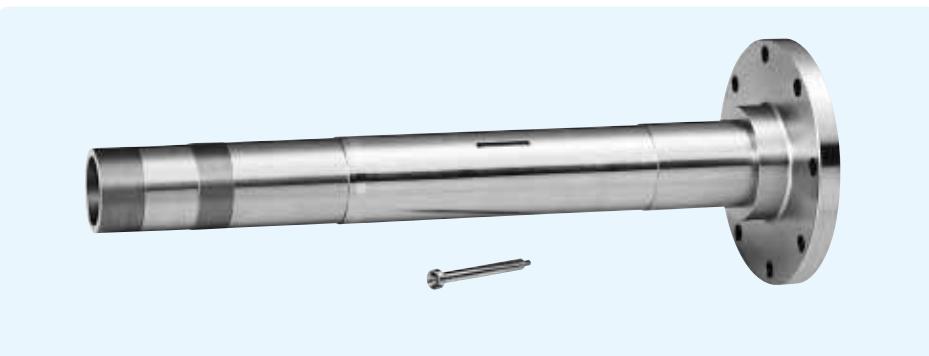

### Material and Heat Treatment

NB's non-standard material and non-standard shaped parts can be heat treated. Please specify the heat treatment method, hardness, and heat-treated area.

### Gun Drill Machining

**MINIATURE  
SLIDE**

**GONIO WAY**

# SLIDE WAY

The NB slide way is a non-recirculating linear motion bearing utilizing precision rollers. It is used primarily in optical and measurement equipment where high precision movement is required.

## STRUCTURE AND ADVANTAGES

The NB slide way NV type comprises precisely ground rails and R-retainers with built-in STUDROLLERs and precision rollers. The rails have been optimally designed so that the STUDROLLERs move smoothly, and the STUDROLLERs and precision rollers incorporated in the R-retainers enable slip-free operation between the raceway surface and the rollers resulting in motion with minimal frictional resistance.

SV and SVW types consist of precision ground rails and precision caged-rollers. Since caged-rollers do not recirculate, there is only a minimum frictional resistance fluctuation. Also, there is a minimum difference between the static and dynamic frictional resistances.

### Non-slip!

#### STUDROLLER System (Rivet Roller Structure)

The STUDROLLER system is based on a new concept to provide complete prevention of roller cage slippage during operation. This system permits usage in all orientations and positions.

Figure G-1 STUDROLLER System

### Suitable for Minute Motion

Because the frictional resistance is extremely small and there is only little difference between the static and dynamic frictional resistances, the NB slide way is well suited for minute motion, resulting in highly accurate linear movement.

### Low-Speed Stability

Since the frictional resistance fluctuation is small even under low-load conditions, stable motion is obtained from low to high speeds.

### High Rigidity and High Load Capacity

Compared to the ball elements, the rollers provide a larger contact area and less elastic deformation, thus the NB slide way has high rigidity and high load capacity. With new NV rail design, the roller contact area is increased by 30 to 58% (Figure G-2). The number of effective rollers is increased by narrowing the roller pitch. Thus, the NV type has the load rating that is 1.3 to 2.5 times that of the SV type.

### Low Noise

The slide way never produces recirculation noise nor roller-contact noise due to a use of roller cage, resulting in quiet motion.

### All Stainless Steel Type Available

The anti-corrosion SVS/SVWS slide ways have all stainless steel components, making them ideal for use in clean room applications.

Figure G-2 Roller Contact Profile

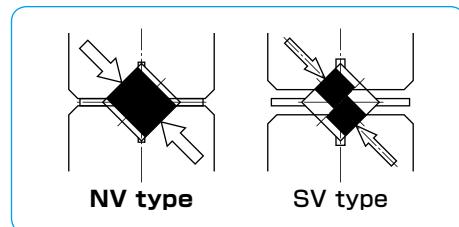

Figure G-3 Structure of NV type

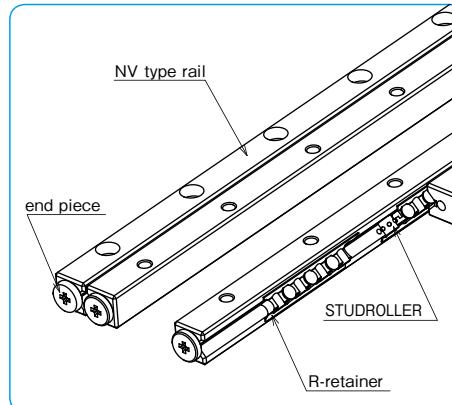

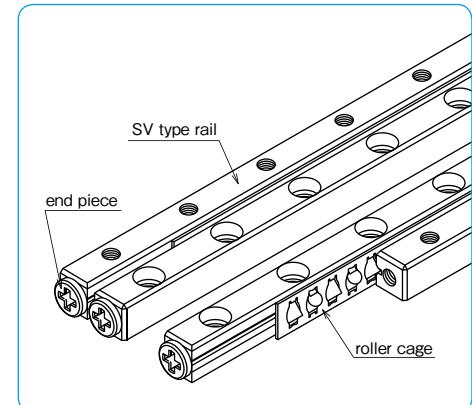

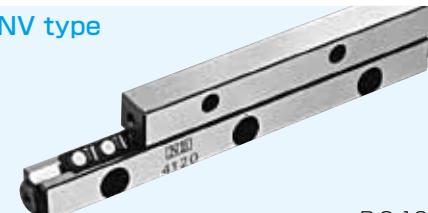

Figure G-4 Structure of SV type

※To the NV type, fastening plates are attached for the purpose of maintaining the center position of the R-retainer before assembly. Please see Installation Procedure on page G-7 and remove the fastening plates before use.

## TYPES

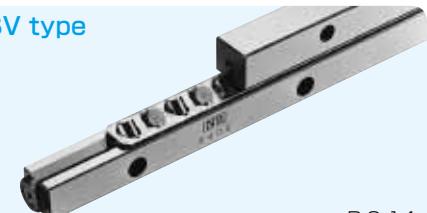

### NV type

P.G-10

The NV slide way consists of a set of four rails, two R-retainers, and eight end pieces. It permits flexible design of the table which will best suit your application. The NVS type is available with stainless steel rails and resin retainers, which is suitable for anti-corrosion requirements.

### SV type

P.G-14

The SV slide way consists of a set of four rails, two R type roller cages, which have precision rollers in a cross arrangement, and eight end pieces. The all stainless steel option makes it suitable for use in corrosive environments.

### SVW type

P.G-22

The SVW slide way consists of two SV-type rails, one W type rail, two R type roller cages, and eight end pieces. The use of a W-type rail serves for a compact design. The SVWS type is also available with all stainless steel components.

## ACCURACY

The accuracy of the slide way is represented as parallelism measured across the full length with a method shown in Figure G-6. It is classified as high (blank), precision (P), or ultra precision (UP). Special accuracies can also be accommodated. Please contact NB for details.

Figure G-5 Parallelism

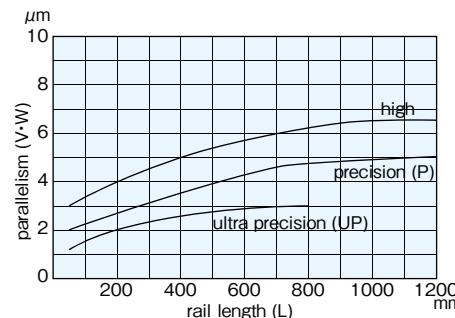

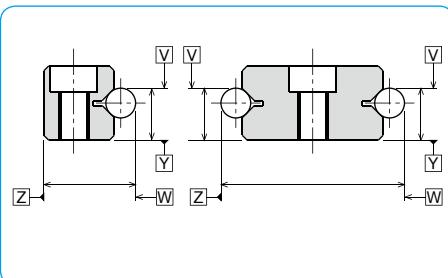

Figure G-6 Accuracy Measurement Method

Ultra precision grade is available from size 1 to size 9.

## RATED LIFE

The life of the slide way and the slide table is calculated with the following equations:

Rated Life

$$L = \left( \frac{f_T}{f_W} \cdot \frac{C}{P} \right)^{10/3} \cdot 50$$

L: rated life (km) f<sub>T</sub>: temperature coefficient f<sub>W</sub>: applied load coefficient  
C: basic dynamic load rating (N) P: applied load (N)

\* Please refer to page Eng-5 for the coefficients.

Life Time

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_i \cdot 60}$$

L<sub>h</sub>: life time (hr) l<sub>s</sub>: stroke length (m)  
n<sub>i</sub>: number of cycles per minute (cpm)

## LOAD RATING

The load rating for the slide way is obtained using the equations listed in Table G-1.

Table G-1 Load Rating

condition	single-rail usage	single-rail vertical usage	double-rail parallel usage
direction of load			
basic dynamic load rating C	$C = \left[ 2P \left( \frac{Z}{2} - 1 \right) \right]^{\frac{1}{36}} \cdot \left( \frac{Z}{2} \right)^{\frac{3}{4}} \cdot C_1$	$C = \left[ 2P \left( \frac{Z}{2} - 1 \right) \right]^{\frac{1}{36}} \cdot \left( \frac{Z}{2} \right)^{\frac{3}{4}} \cdot 2^{\frac{7}{9}} \cdot C_1$	
basic static load rating Co	$Co = \frac{Z}{2} \cdot Co_1$	$Co = \frac{Z}{2} \cdot Co_1 \cdot 2$	
allowable load F	$F = \frac{Z}{2} \cdot F_1$	$F = \frac{Z}{2} \cdot F_1 \cdot 2$	

C: basic dynamic load rating (N) Co: basic static load rating (N) F: allowable load (N) C<sub>1</sub>: basic dynamic load rating per roller (N)

Co<sub>1</sub>: basic static load rating per roller (N) F<sub>1</sub>: allowable load per roller (N)

Z: number of rollers per cage Z/2: number of effective rollers (round down to whole number) P: roller pitch (mm)

The load rating of the NV type differs depending on the direction of the load.

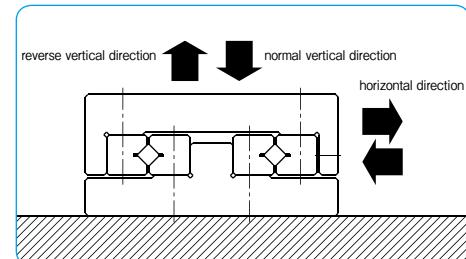

Table G-2 Change of Load Rating Corresponding to Load Direction

basic dynamic load rating	normal vertical direction	1.0 × C
	horizontal direction	0.85 × C
	reverse vertical direction	0.7 × C
basic static load rating	normal vertical direction	1.0 × Co
	horizontal direction	0.85 × Co
	reverse vertical direction	0.7 × Co

\*There may be a difference depending on the size. Please contact NB for details.

Consideration has been given to holes for STUDROLLERS in the raceway surface in calculation of load ratings.

Figure G-7 Direction of Load

cage material: aluminum alloy C<sub>1</sub>: dynamic load rating per roller C<sub>01</sub>: static load rating per roller

F<sub>1</sub>: allowable load per roller

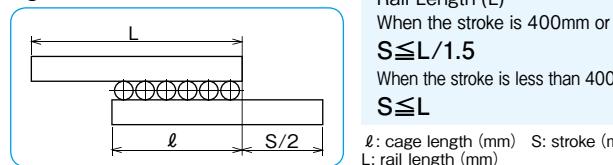

## STROKE

Please contact NB for a non-standard stroke length for the NV type. When the stroke of SV type or SVW type is changed, the stroke length must be determined and the load rating should be re-estimated as follows.

### Stroke of SV type, SVW type

When the slide way moves along the rail, the cage moves half the distance traveled by the slide way in the same direction. Therefore, although the work may be fixed on the table, the distance between the load center and the cage center will change. To achieve stable accuracy, determine the stroke and the length of the rail as follows.

Figure G-8

## LUBRICATION AND DUST PREVENTION

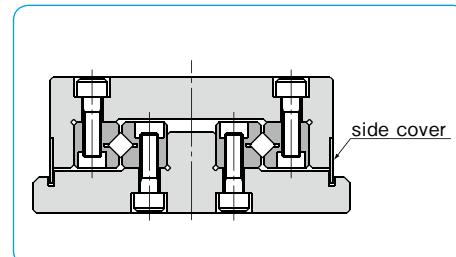

### Lubrication

The slide way is pre-lubricated with lithium soap-based grease prior to shipment for immediate use. Make sure to relubricate with a similar type of grease periodically according to the operating conditions. NB also provides low dust generation grease. Please refer to page Eng-39 for details.

### Dust Prevention

Foreign particles or dust in the slide way affects the motion accuracy and shortens the life time. In a harsh environment please provide side covers for dust prevention. (refer to Figure G-9)

Figure G-9 Example of Dust Prevention Mechanism

## MOUNTING

### Example

Figure G-10 NV type, SV type

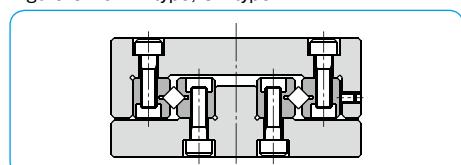

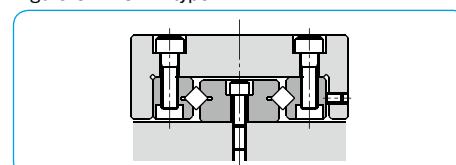

Figure G-11 SVW type

### Accuracy of Mounting Surface

To maximize the performance of the NB slide way, it is recommended that the accuracy of the mounting surface to be equal to or greater than the degree of parallelism of the slide way.

- Parallelism of surface 1 against surface A
- Perpendicularity of surface 2 against surface A
- Parallelism of surface 3 against surface B
- Perpendicularity of surface 4 against surface B
- Parallelism of surface 2 against surface C
- Parallelism of surface 4 against surface C

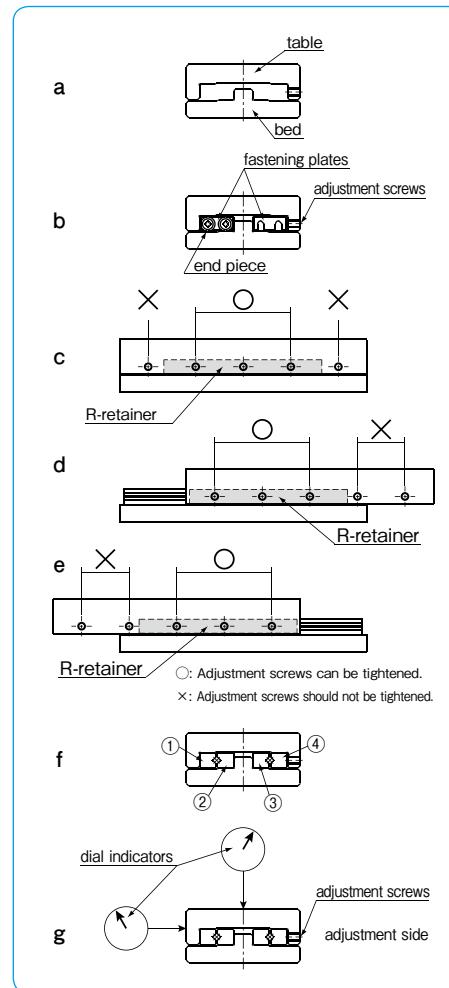

## INSTALLATION PROCEDURE OF NV TYPE

### Installation Procedure

\*Please read "Use and Handling Precautions" before installation.

- (1) Remove burrs, scratches, and dust from the rail-mounting surface of the bed and the table, be careful to prevent contamination during assembly.
- (2) Apply low-viscosity oil to the contact surfaces, and align the bed and the table. (Figure G-13a)
- (3) Set the reference surface onto the mounting surface with the rails fastened. Set the table in the center position, and tighten the adjustment screws lightly so that almost no gap remains. (Figure G-13b)
- (4) Keep the table in the center, tighten the rail mounting bolts lightly, loosen the end pieces of both ends, and remove the fastening plates. Following this, lightly retighten the end pieces.
- (5) While maintaining the conditions of (4), gently move the assembly through its stroke to check if the maximum stroke is secured, and if there is no irregularity.
- (6) Move the table to the center and tighten only the adjustment screws on the R-retainer with the recommended torque shown in Table G-3. (Figure G-13c)
- (7) Gently move the table to one stroke end, and check that the table has surely come into contact with the external mechanical stopper. Following this, tighten the adjustment screws in the same manner as (6). (Figure G-13d)
- (8) Move the table to the opposite stroke end, and tighten in the same manner as (6). (Figure G-13e)
- (9) Fasten the mounting screws on rails 1, 2, and 3 by tightening with the recommended torque shown in Table G-4. (Figure G-13f)
- (10) Set the dial indicators to the center of the table and to the side (reference surface) of the table. (Figure G-13g)
- (11) Perform the final preload adjustment. While moving the table back and forth, repeat steps (6) to (8) until the dial indicators show a minimum deviation.
- (12) Fasten rail 4 securely with the recommended torque. As for the adjustment screws, successively tighten the mounting screws on the R-retainer by moving the table.
- (13) Recheck the motion accuracy while moving the table.
- (14) Tighten the end pieces finally.

Figure G-13 Installation Method

## INSTALLATION PROCEDURE OF SV TYPE

### Installation Procedure

- (1) Remove burrs, scratches, and dust from the rail-mounting surface of the bed and the table, be careful to prevent contamination during assembly.
- (2) Apply low-viscosity oil to contact surfaces. Attach rails ①~③ by tightening screws with the recommended torque (Table G-4). (Figure G-14a)
- (3) Temporarily attach rail ④ on the adjustment side. (Figure G-14b)
- (4) Remove end pieces on one end. Carefully insert roller cages between rails. (Figure G-14c)
- (5) Re-attach end pieces.
- (6) Move the table slowly to each stroke end to position roller cages at the center of the rails.
- (7) Set the dial indicators to the center of the table and to the side (reference surface) of the table. (Figure G-14d)
- (8) Move the table to one stroke end. Lightly tighten adjustment screws on the roller cage. (Figure G-14e)
- (9) Move the table to the opposite stroke end. Similarly lightly tighten adjustment screws on the roller cage. (Figure G-14f)
- (10) Move table to the center and lightly tighten center adjustment screws. (Figure G-14g)
- (11) Repeat steps (8) ~ (10) until the indicators show a minimum deviation. Please do not apply an excessive preload.
- (12) Make final adjustment of preload. Repeat steps (8) ~ (10) and tighten the adjustment screws with the recommended torque listed in Table G-3.
- (13) Fasten the rail ④ securely with the recommended torque. As with the adjustment screws, successively tighten the mounting screws by moving the table.

Figure G-14 Installation Method

## USE AND HANDLING PRECAUTIONS

### Careful Handling

Dropping the slide way causes the rolling elements to make dents in the raceway surface. This will prevent smooth motion and will also affect accuracy. Be sure to handle the product with care. The NV type is packaged as a set of rails and R-retainers. Do not separate or disassemble until assembly/installation is completed. Precision is not guaranteed if disassembled.

### Fastening Plates

For the NV type, fastening plates are attached at both end faces of the rails to maintain the R-retainer center position prior to assembly. The fastening plates are not required after the NV type is mounted to a table and bed, however, when removal of the NV type is necessary such as when it will be reassembled, be sure to return the R-retainer to the proper center position, secure the fastening plates with the end pieces, and then remove the NV type.

### Specified Allowable Stroke

For the NV type, exceeding the specified stroke (over-stroke) shall cause the raceway surface of the rail to be damaged and the performance of the STUDROLLER to drastically deteriorate. Be sure to provide external mechanical stoppers.

### Adjustment

Using the product with insufficient accuracy of the mounting surface or before adjusting the preload will cause the motion accuracy of the product to drop and will have a negative influence upon product life and accuracy. Make sure to assemble, install, and adjust the product with care.

### Caution against Excess Preload

It is essential to give preload on the Slide Way products in order to assure rigidity and accuracy. However, excess preload causes damage on the raceways and roller cages/R-retainers.

On installation, please follow the installation procedure and recommended torque on page G-8.

### Operating Temperature

The NV type uses resin parts. Please use the product in environments that are lower than 80°C.

### Use as a Set

The accuracy of the rails has been matched within each set. Note that the accuracy will be affected when the rails of different sets are combined.

### Allowable Load

The allowable load is a load under which the sum of elastic deformations of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate linear motion is required, make sure to use the product within the allowable load.

### Cage Slippage

For the SV/SVW type, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is advised that the stroke be set with sufficient margin and an excessive preload should be avoided.

It is also recommended that the rails be cycled to perform the maximum stroke several times, so that the cage returns to its central position.

### End Pieces

End pieces are attached to each end of the slide way to prevent removal of the cage. Do not use them as a mechanical stopper.

### Knock Pin Hole

When using SVW type knock pin holes to attach a slide way, please do the hole-machining on the mounting surface after attaching the W type rail. After machining, remove the chips completely and wash as required.

# SLIDE TABLE

The NB slide table is a precision table equipped with a slide way. Its high-precision and low-friction characteristics make it well suited for use in electronics automatic-assembly machines, optical measurement devices, etc.

## STRUCTURE AND ADVANTAGES

The NB slide table consists of a slide way sandwiched between an accurately machined table and a bed. Stoppers are provided inside the table.

### High Accuracy

The mounting surfaces of the table and bed are precision finished to ensure high precision linear motion, resulting in a high performance slide way.

### Low Friction

Its non-recirculating mechanism provides stable motion at from low to high speeds.

### Compact and High Rigidity

Being designed compactly, the NB slide table holds the high load capacity and high rigidity characteristics.

Figure G-16 Structure of NVT type

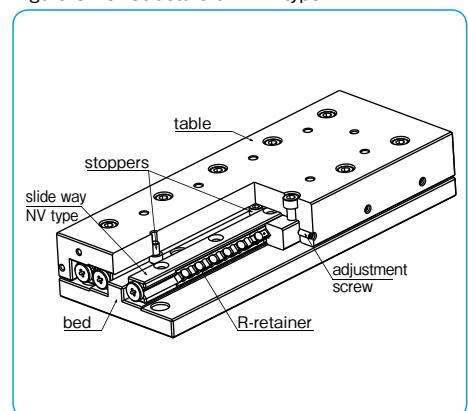

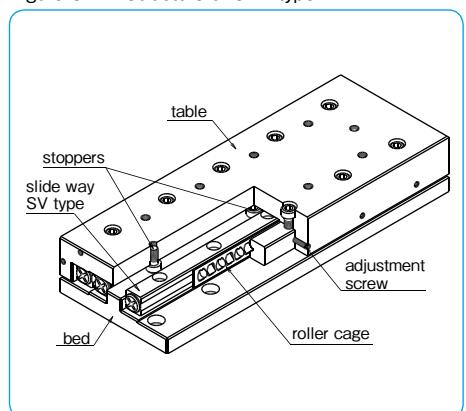

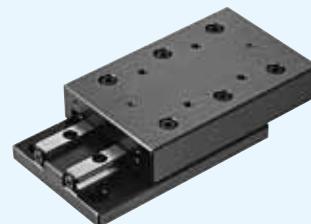

Figure G-17 Structure of SVT type

## TYPES

### NVT・NVTS type

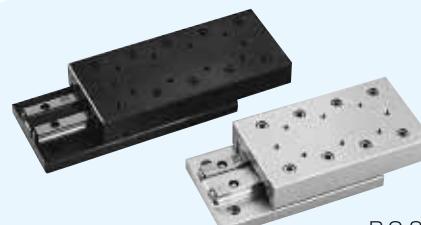

P.G-28

The NVT type slide table incorporates the NV type slide way. The table and bed have been precision machined to provide a high degree of accuracy and the product can be used, without any need for troublesome accuracy or preload adjustments.

In the NVTS type, the anti-corrosion NVS type slide way is sandwiched between an accurately machined aluminum table and bed.

### SVT・SVTS type

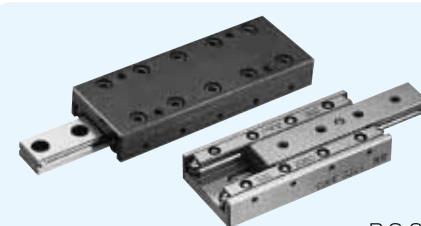

P.G-32

In the SVT type slide table, the SV type slide way is sandwiched between an accurately machined steel table and bed.

In the SVTS type, the anti-corrosion SVS type slide way is sandwiched between an accurately machined aluminum table and bed.

### SYT・SYTS type

P.G-38

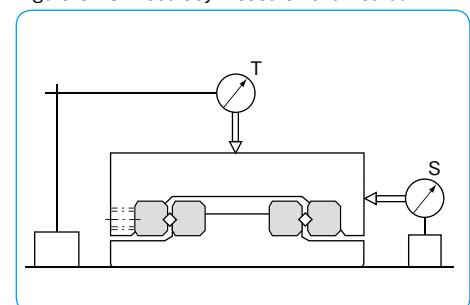

The SYT/SYTS type is a thin, compact slide table. Either tapped or counterbore type (D type) is available for the mounting hole.

The anti-corrosion SYTS type slide table is made of all stainless steel components, making it suitable for use in clean rooms.

## ACCURACY

The motion accuracy of a slide table is measured by placing indicators at the center of the top and side surface of the table, as illustrated in Figure G-18. It is expressed in terms of the indicator deviation when the table is moved the full stroke without any load.

Figure G-18 Accuracy Measurement Method

## RATED LIFE

The life of an NB slide table is calculated using the following equations.

### Rated Life

$$L = \left( \frac{f_T}{f_W} \cdot \frac{C}{P} \right)^{10/3} \cdot 50$$

L: rated life(km) f<sub>T</sub>: temperature coefficient f<sub>W</sub>: applied load coefficient  
C: basic dynamic load rating(N) P: applied load(N)

\*Please refer to page Eng-5 for the coefficients.

### Life Time

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L<sub>h</sub>: life time (hr) l<sub>s</sub>: stroke length (m)  
n<sub>1</sub>: number of cycles per minute (cpm)

## LOAD RATING

The load rating of the slide table NVT type differs depending on the direction of the load.

Table G-6 Change of Load Rating Corresponding to Load Direction

basic dynamic load rating	normal vertical direction	1.0×C
	horizontal direction	0.85×C
	reverse vertical direction	0.7×C
basic static load rating	normal vertical direction	1.0×C <sub>0</sub>
	horizontal direction	0.85×C <sub>0</sub>
	reverse vertical direction	0.7×C <sub>0</sub>

\*There may be a difference depending on the size.

Please contact NB for details.

Consideration has been given to holes for STUDROLLERS in the raceway surface in calculation of load ratings.

## USE AND HANDLING PRECAUTIONS

### Careful Handling

Dropping the slide table causes the rolling elements to make dents in the raceway surface. This will prevent smooth motion and will also affect accuracy. Be sure to handle the product with care.

### Dust Prevention

Dust and foreign particles affect the accuracy and lifetime of a slide table. A slide table used in a harsh environment should be protected with a cover.

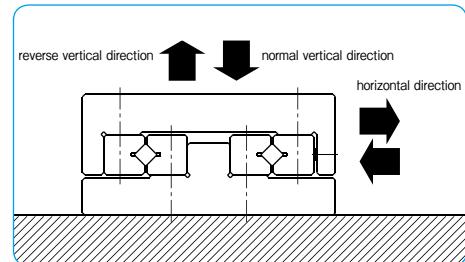

### Lubrication

The slide table is prelubricated with lithium soap based grease prior to shipment for immediate use. Make sure to relubricate with a similar type of grease periodically depending on the operating conditions.

### Cage Slippage

For the SVT/SVT type, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is advised

Figure G-19 Direction of Load

that the motion speed be kept under 30m/min under general operating conditions. It is also recommended that the rails be cycled to perform the maximum stroke several times, so that the cage returns to its central position.

### Adjustment/Installation Screw

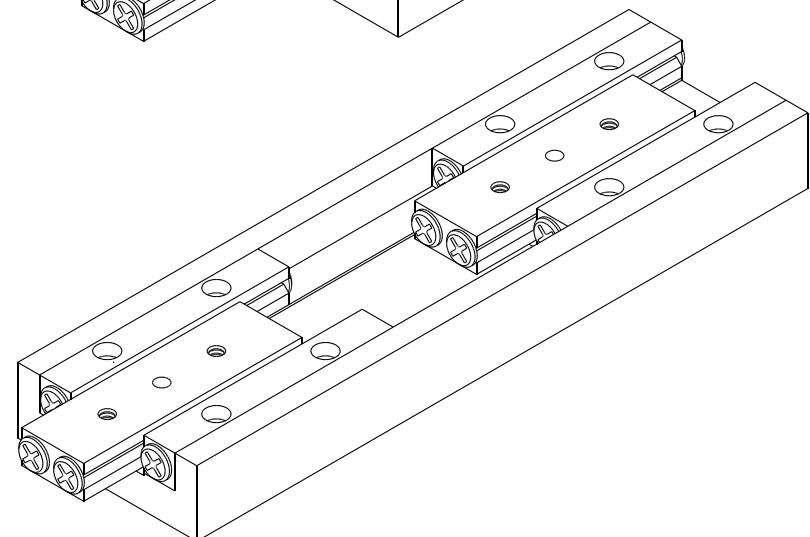

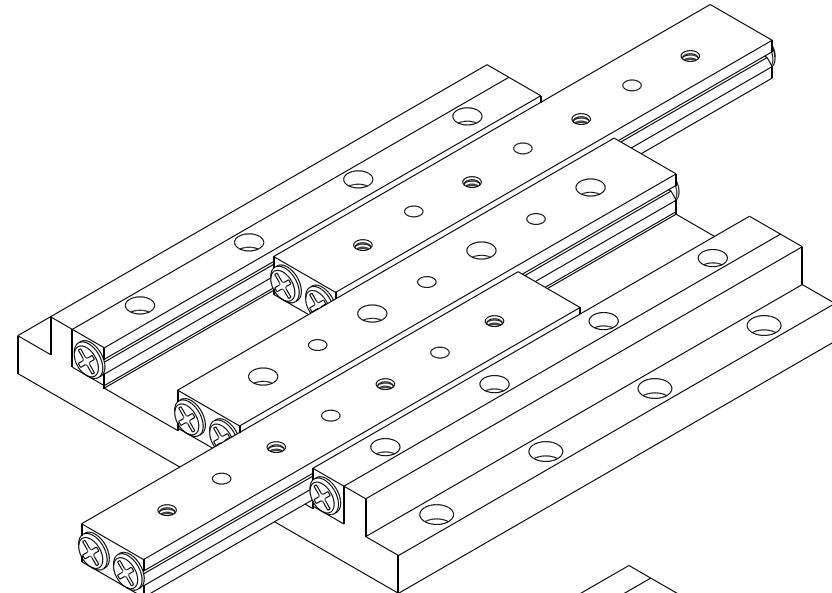

The NB slide table is adjusted to achieve optimum accuracy and preload. The adjustment screw and rail installation screws should be kept untouched.

### Allowable Load

The allowable load is a load under which the sum of elastic deformations of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate linear motion is required, make sure to use the product within the allowable load.

## SPECIAL REQUIREMENTS

NB can machine tables to meet special requirements, including tables with a micrometer head and tables for projectors. Please contact NB for details.

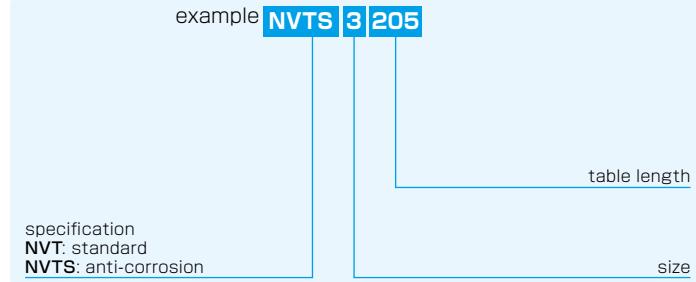

## NVT TYPE

# MINIATURE SLIDE

The NB miniature slide SYBS type is a limited stroke table with the most compact envelope dimensions, featuring two ball raceway grooves. The SYBS type utilizes balls as the rolling elements. The ultra compact design contributes greatly to the creation of smaller and lighter industrial machinery and equipment of all types.

## STRUCTURE AND ADVANTAGES

The NB miniature slide incorporates a unique integrated ball cage between the table and bed. All components have been produced with high precision machining.

### Ultra Compact Design

The table height of the SYBS type is 3.2~4.5mm and the width is 6~12mm. This compact size when compared with conventional slide tables helps to realize the miniaturization of machinery and equipment.

### Low Friction • Low Noise

Since the rolling ball elements do not recirculate, the frictional resistance will not vary significantly resulting in smooth, high precision operation. Additionally, the

ball cage greatly reduces the contact noise of the rolling elements bringing about a low-noise operation.

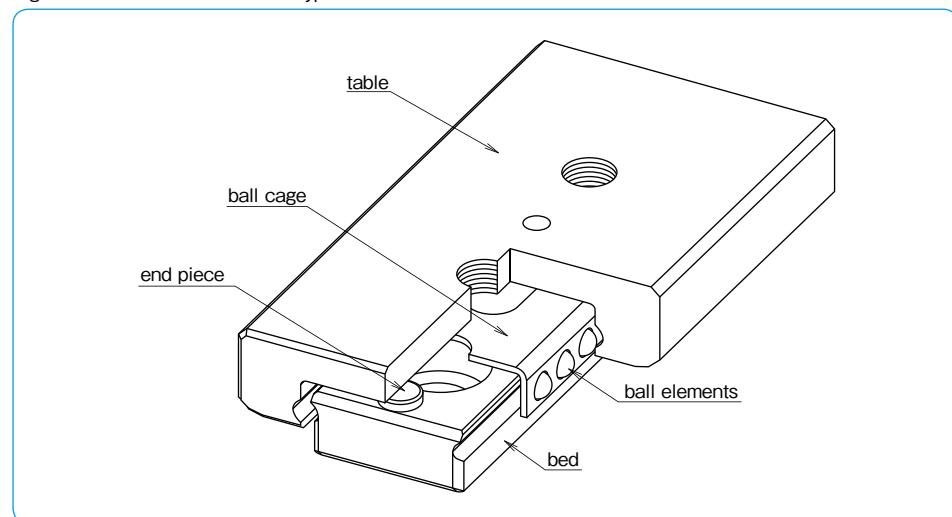

### High Accuracy

The ball raceway grooves of each of the bed and table are processed through simultaneous precision machining resulting in minimal processing errors, and bringing about extremely smooth, precision linear movement.

### Stainless Steel Structure

The SYBS type is made of all stainless steel components. This allows for use in corrosive or high temperature applications. The SYBS is a perfect component for vacuum or clean room environments.

Figure G-20 Structure of SYBS type

## ACCURACY

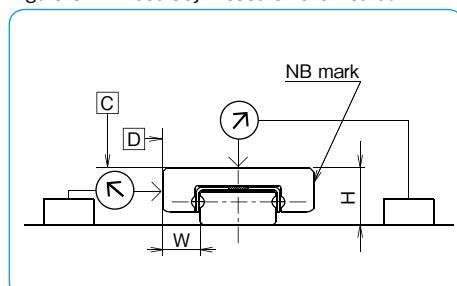

Table G-7 shows the accuracy of the SYBS miniature slide.

The deviation is measured as Figure G-21 illustrates. Dial indicators are placed to the center of the table's top and the reference surface side (opposite from the NB mark) and then the table is moved the full stroke without any load.

Table G-7 Accuracy unit/mm

item	tolerance
height H	±0.020
width W	±0.025
deviation from center of surface C	0.004
deviation from center of surface D	0.006

Figure G-21 Accuracy Measurement Method

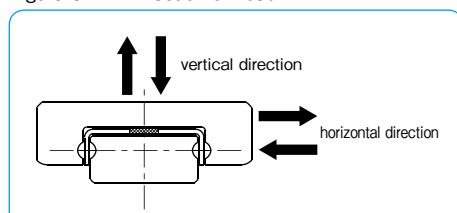

## LOAD RATING

The load rating of the miniature slide varies depending on the direction of the applied load.

Table G-8 Change of Load Rating Corresponding to Load Direction

basic dynamic load rating	vertical direction	1.00×C
	horizontal direction	1.13×C
basic static load rating	vertical direction	1.00×Co
	horizontal direction	1.19×Co

Figure G-22 Direction of Load

## RATED LIFE

The life of an NB miniature slide is calculated using the following equations:

### Rated Life

$$L = \left( \frac{f_T}{f_W} \cdot \frac{C}{P} \right)^3 \cdot 50$$

L: rated life (km) f<sub>T</sub>: temperature coefficient

f<sub>W</sub>: applied load coefficient C: basic dynamic load rating (N)

P: applied load (N)

\* Refer to page Eng-5 for the coefficients.

### Life Time

$$L_h = \frac{L \cdot 10^3}{2 \cdot l_s \cdot n_1 \cdot 60}$$

L<sub>h</sub>: life time (hr) l<sub>s</sub>: stroke length (m)

n<sub>1</sub>: number of cycles per minute (cpm)

## MOUNTING

### Mounting Surface Profile

In most general installations, the miniature slide is mounted by pushing the reference surface of the bed and table against a shoulder that is set up on the mounting surface. Machined undercuts should be used in the corners of the shoulder (as illustrated in Figure G-23) so that the corners will not interfere with the reference surfaces of the bed and table. Table G-9 lists the recommended shoulder heights of the mounting reference surfaces.

When installing the miniature slide table without providing machined undercuts, the corner radius should be realigned as illustrated in Figure G-24. Table G-10 lists the values of the corner radius of the mounting surface.

Figure G-23 Mounting Surface Profile-1

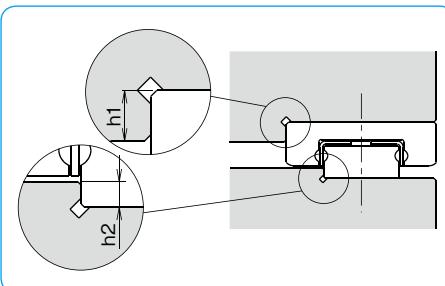

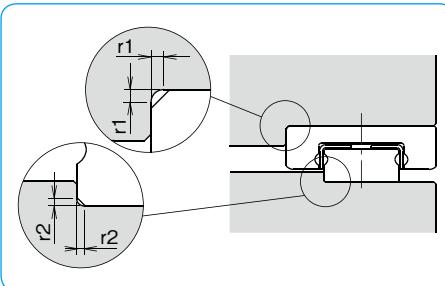

Figure G-24 Mounting Surface Profile-2

### Recommended Torque Value

The bed should be tightened with a consistent torque by using a torque wrench. Table G-11 lists the recommended torque.

Table G-11 Recommended Torque unit/N·m

size	torque
M1	0.03
M1.6	0.15
M2	0.3

(for stainless steel screw A2-70)

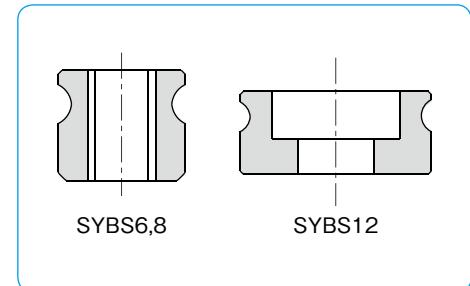

Table G-9 Shoulder Height on Mounting Reference Surface unit/mm

part number	shoulder height for table h1	shoulder height for bed h2
SYBS 6	1.0	0.5
SYBS 8	1.2	0.8
SYBS12	1.5	0.8

Table G-10 Maximum Corner Radius unit/mm

part number	mounting surface for table	mounting surface for bed
	r1	r2
SYBS 6	0.1	0.05
SYBS 8	0.15	0.1
SYBS12	0.15	0.1

Figure G-25 Profile of SYBS Bed

### Mounting Example and Mounting Screw

All the mounting holes are fully through-hole. Mount the SYBS type as illustrated in Figure G-26 after considering the size of mounting screw, the maximum penetration depth, and the height of the bed. Make certain that the mounting screws do not interfere with the ball cage; otherwise, the accuracy and travel life will be affected adversely. Special screws for SYBS type are available from NB. Please refer to Table G-12 for dimensions of mounting screws.

Figure G-26 Mounting Example

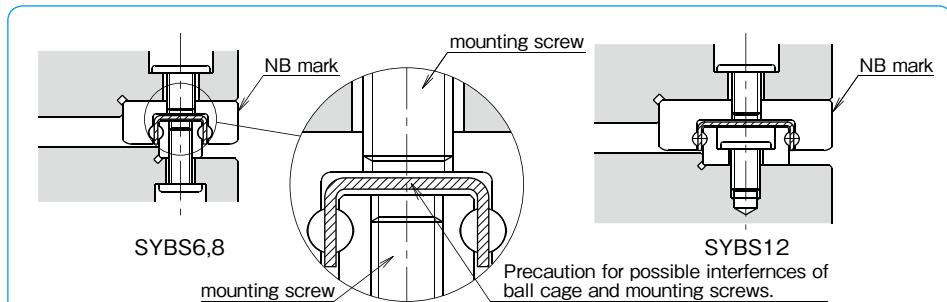

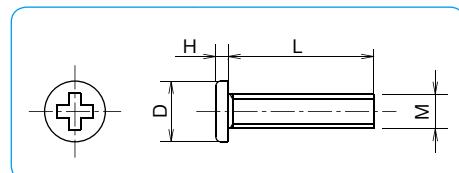

Table G-12 Mounting Screw (stainless steel)

M (size)	D mm	H mm	pitch mm	L mm
M1	1.8	0.45	0.25	5
M1.4	2.5	0.5	0.3	6
M1.6	2.3	0.5	0.35	4, 5, 6
M2	3	0.6	0.4	6

Figure G-27 Mounting Screw

## USE AND HANDLING PRECAUTIONS

### Preload

The SYBS miniature slide is provided with a slightly positive clearance type only.

### End Piece

On both ends of the SYBS miniature slide bed section, screws are attached to prevent the ball cage from escaping. Please note that the screws are designed only to prevent the ball cage from escaping and are not intended for the use as a mechanical stopper. The ball cage may become deformed on contact with the stopper and this will result in a negative affect of the accuracy and travel life.

### Lubrication

NB miniature slide SYBS type is supplied with an initial application of lithium soap grease and therefore is ready for immediate use. Make sure to relubricate with a similar type of grease periodically according to the operating conditions. For use in clean rooms or vacuum environments, miniature slide tables without grease or with customer specified grease are available. NB also provides low

dust generation grease. Please refer to page Eng-39 for details.

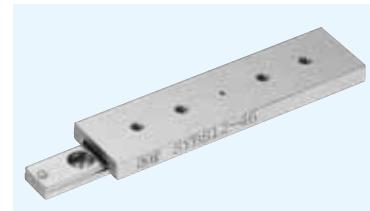

### Cage Slippage

For the SYBS type, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is advised that the motion speed be kept under 30m/min under general operating conditions. It is also recommended that the table be cycled to perform the maximum stroke several times, so that the cage returns to its central position.

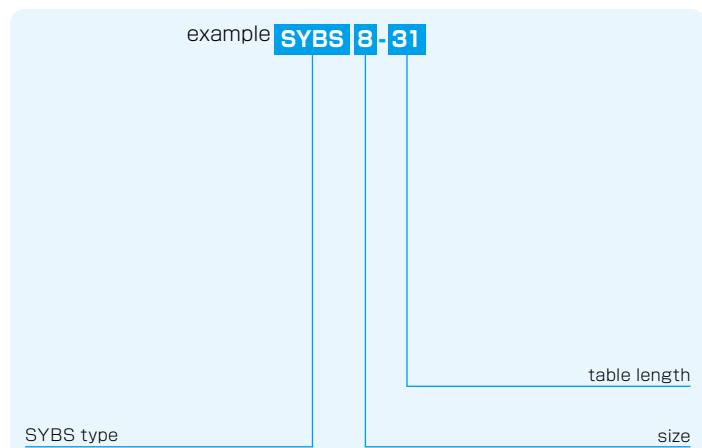

### Allowable Load

The allowable load is a load under which the sum of elastic deformation of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate liner motion is required, make sure to use the product within the allowable load values.

# GONIO WAY

The NB gonio way is a curved cross roller slide way. It is a curved motion bearing utilizing low-friction, non-recirculating precision rollers. It is used when there is a need to change the gradient or obtain an accurate gradient angle without changing the center of rotation in high-precision optical and measurement equipment.

## STRUCTURE AND ADVANTAGES

The NB gonio way RVF type consists of curved tracking bases with precisely ground V-grooves and flat installation surfaces, as well as curved roller cages. The NB gonio way RV type consists of curved rails with precisely machined V-grooves and curved roller cages. Precision rollers are employed as the rolling elements, since the rolling elements do not recirculate, the frictional resistance will not vary significantly, providing curved movement with extremely low frictional resistance.

### Low Frictional Resistance and Minute Motion

The precision grinding and curved roller cage allow for extremely low frictional resistance. The negligible difference between static and dynamic frictions allows the gonio way to follow minute movements accurately, realizing curved movement of high accuracy.

### Low Noise

Since NB gonio way employs a non-recirculating design, there is no noise from the circulating area. In addition, the curved roller cage realizes quiet operation without contact noise between the rolling elements.

### High Rigidity and High Load Capacity

The rollers provide a larger contact area and less

Figure G-28 Structure of Gonio Way RVF type

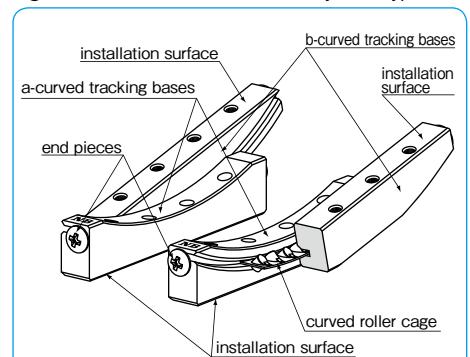

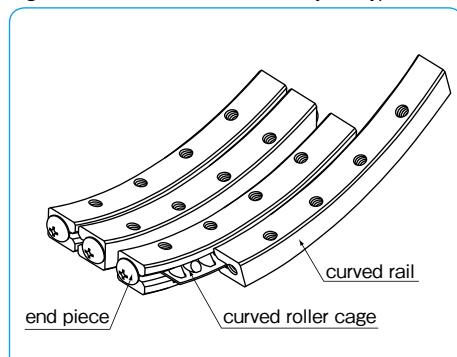

Figure G-29 Structure of Gonio Way RV type

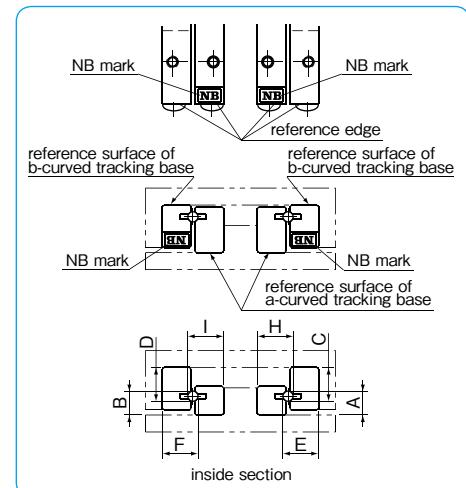

## ACCURACY OF RVF TYPE

The accuracies of the gonio way RVF type are represented by mutual dimensional errors of four rails, which are measured along the overall length using the procedure as shown in Figure G-30.

part number	unit / $\mu\text{m}$	
	mutual error between A and B mutual error between C and D	mutual error between E and F mutual error between H and I

Figure G-30 Accuracy Measuring Method

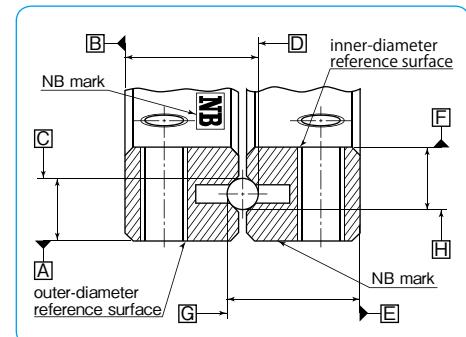

## ACCURACY OF RV TYPE

The accuracies of the gonio way RV type are represented by mutual dimensional errors of four rails, which are measured along the overall length using the procedure as shown in Figure G-31.

part number	unit / $\mu\text{m}$	
	accuracy	
RV2040- 50		
RV2060- 60		
RV3070- 90		
RV3070-110	10	
RV3100-160		

Figure G-31 Accuracy Measuring Method

The reference surfaces are located on the opposite side of the NB mark. There are inner reference surface and outer reference surface in one set of RV.

## RATED LIFE

The life of a gonio way is obtained using the following equations.

Rated Life

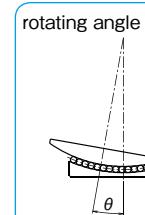

$$L = \frac{90}{\theta} \times \left( \frac{f_T}{f_w} \times \frac{C}{P} \right)^{\frac{10}{3}}$$

L: travel life ( $10^6$ cycles)  $\theta$ : rotating angle (degree)  
C: basic dynamic load rating (N) P: applied load (N)  
 $f_T$ : temperature coefficient  $f_w$ : applied load coefficient  
※Refer to page Eng-5 for the coefficients.

Life Time

$$L_h = \frac{L \times 10^6}{60 \times n}$$

$L_h$ : life time (hr)  
 $n$ : number of cycles per minute (cpm)

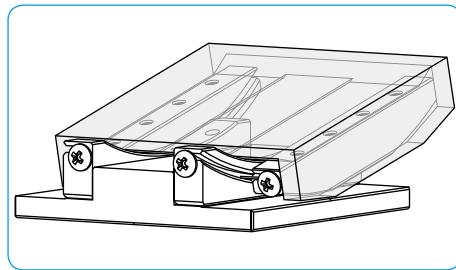

## MOUNTING OF RVF TYPE

### Accuracy of Mounting Surface

To maximize the performance of NB gonio way, it is important to finish the installation surface with high accuracies.

- Parallelism of surface 1 against surface A
- Perpendicularity of surface 2 against surface A
- Perpendicularity of surface 5 against surface A
- Parallelism of surface 3 against surface B
- Perpendicularity of surface 4 against surface B
- Perpendicularity of surface 6 against surface B
- Parallelism of surface 2 against surface C
- Parallelism of surface 4 against surface C

Figure G-33 Example of Installation of RVF type

### Installation Procedure

#### Setting the curved tracking bases temporarily

- (1) Remove burrs, stains, and dust from the installation surfaces of the curved tracking bases of tables and beds. Foreign particles must be kept out of the assembly work as well.
- (2) Apply low viscosity oil to contact surfaces, check the reference edges of an a-curved tracking base and bed, and then tighten the screws temporarily. (Figure G-34a)
- (3) Align the reference edges (NB mark side) of a b-curved tracking base and an a-curved tracking base to the same orientation. Then, insert the curved roller cages between the curved tracking bases at the center area. Make sure that the curved roller cages will not interfere with the curved raceway grooves of the curved roller tracking bases. (Figure G-34b)
- (4) Check the reference edge of the table, set the table over the b-curved tracking base, and then secure the table temporarily. (Figure G-34c)

Figure G-32 Accuracy of Mounting Surface

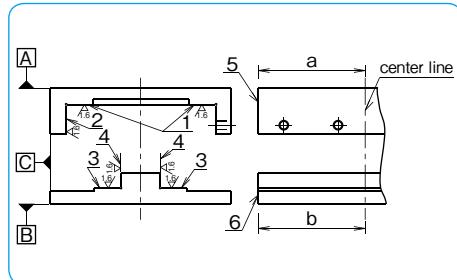

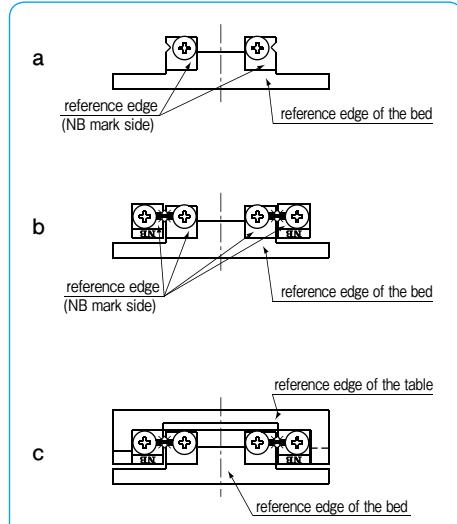

Figure G-34 Installation Method (1)

#### Setting four curved tracking bases in parallel position

- (5) Move the table to the maximum stroke ends of both sides and adjust the setting so that the curved roller cage is positioned at the center of the curved tracking base.
  - (6) Move the table to the center position and tighten the adjustment screws with "slightly strong torque" by using a torque wrench. (Figure G-35d)
- \*"Slightly strong torque" here means slightly stronger than the torque at which the oscillation of the dial indicator is stabilized at the minimum value when the table is moved right and left, or when pressure is applied to the rolling direction while the dial indicator is attached to the side face (reference side) of the table. (Figure G-35i)
- (7) Move the table to the maximum stroke end of one side and tighten the adjustment screws on the curved roller cage with the same torque as in step (6). (Figure G-35e)
  - (8) Move the table to the maximum stroke end of the other side and tighten the adjustment screws with a torque wrench by repeating the procedure above. (Figure G-35f)

#### Securing the curved tracking bases

- (9) Mount an edge reference plate between the reference edge of the a-curved tracking base and end piece, press it against the reference edge of the bed, and then tighten only the mounting screws in the middle. (Figure G-35g)
- (10) Repeat the procedure above to mount an edge reference plate between the reference edge of the b-curved tracking base and the end piece. Press it against the reference edge of the bed, and then tighten only the mounting screws in the middle. (Figure G-35h) In order to maintain parallelism of curved tracking bases, do not cycle the table during this process and make sure that there is no clearance between the edge of the table and the edge reference plate.
- (11) Secure the rest of the mounting screws on the curved roller cage one by one by moving the table as instructed in steps (7) and (8).

#### Adjusting the preload

- (12) Move the table to the right and left with the test indicator attached to the side face of the table (reference side). Or, apply pressure in the rolling direction and confirm that the oscillation of the indicator is stabilized at the minimum level. (Figure G-35i)
- (13) Return the mounting screws on the b-curved tracking base at the adjustment screw side to the temporary setting.
- (14) Return the table to the center position, slightly loosen the adjustment screws in the middle, and then gradually loosen the adjustment screws on the curved roller cage while moving the table as instructed in steps (7) and (8). Make sure not to reduce the preload too much.
- (15) Finally, secure the b-curved tracking base at the adjustment screw side, which has been installed temporarily. Secure the mounting screws on the curved roller cage one by one by moving the table as instructed above.

Figure G-35 Installation Method (2)

## MOUNTING OF RV TYPE

### Accuracy of Mounting Surface

The accuracy of surfaces 1, 2, 3, and 4 (Figure G-36) directly affect the motion accuracy.

To maximize the performance of NB gonio way, it is important to finish the installation surface with high accuracies.

Figure G-36 Accuracy of Mounting Surface

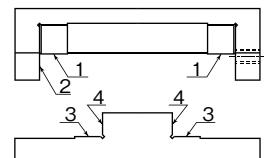

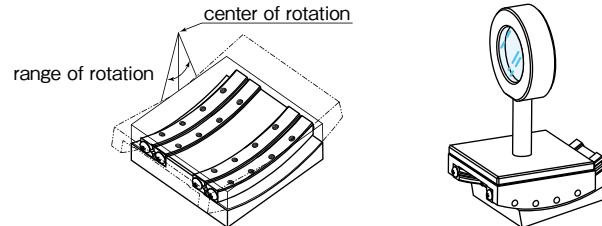

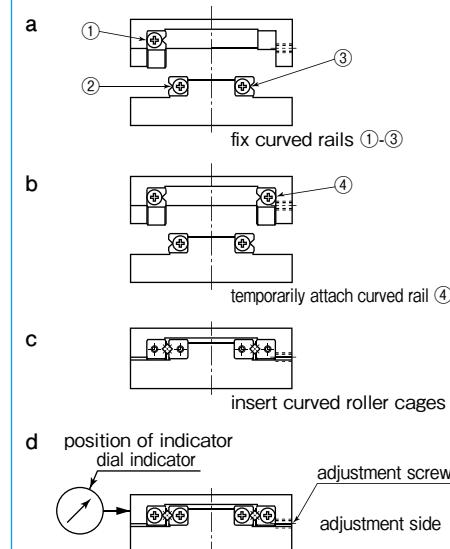

Figure G-37 Example of Installation

### Installation Procedure

- (1) Remove burrs, dirt, dust, etc. from the table and the installation surfaces of the bed.
- (2) Apply a low viscosity oil to contact surfaces. Fix the rail ①inner-diameter reference surface, ②outer-diameter reference surface and ③outer-diameter reference surface by tightening screws to the specified torque. (Table G-16, Figure G-38a)
- (3) Temporarily attach the rail ④inner-diameter reference surface on curved rail to the adjustment side. (Figure G-38b)
- (4) Remove the end pieces on one side of the rails and insert roller cages to the center. (Figure G-38c)
- (5) Re-attach end pieces.
- (6) Move the table to the right and left (in the direction of the stroke) to position roller cages at the center of the curved rails.
- (7) Set an indicator at the side of the table on the reference surface. (Figure G-38d)
- (8) Move the table to one of the stroke ends and tighten the adjustment screws slightly. (Figure G-39e)

Figure G-38 Installation Method (1)

(9) Move the table fully to the other stroke end and tighten the adjustment screws slightly. (Figure G-39f)

(10) Move the table to the center and lightly tighten adjustment screws. (Figure G-39g)

(11) Repeat steps (8)~(10) until there is no clearance around the table. If there is no clearance, the indicator will show a minimum fluctuation value when the table is moved to the right and left. Exercise care so as not to apply an excessive preload.

(12) Repeat steps (8)~(10) and tighten the adjustment screws uniformly by using a torque wrench.

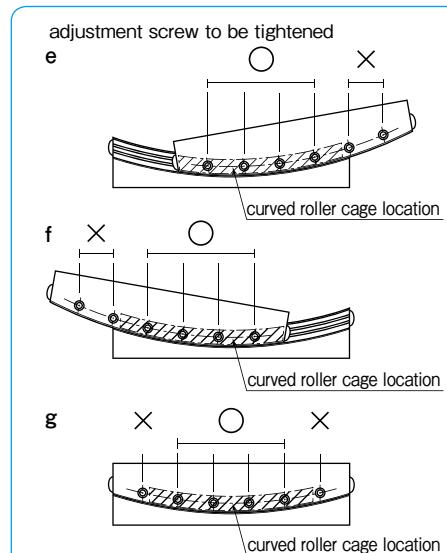

(13) Fix the rail ④inner-diameter reference surface. Tighten the mounting screws sequentially by moving the table in the same manner as with the adjustment screws.

Table G-16 Recommended Torque for Mounting Screw

size	torque unit / N·m
M3	1

(for stainless steel screw A2-70)

Figure G-39 Installation Method (2)

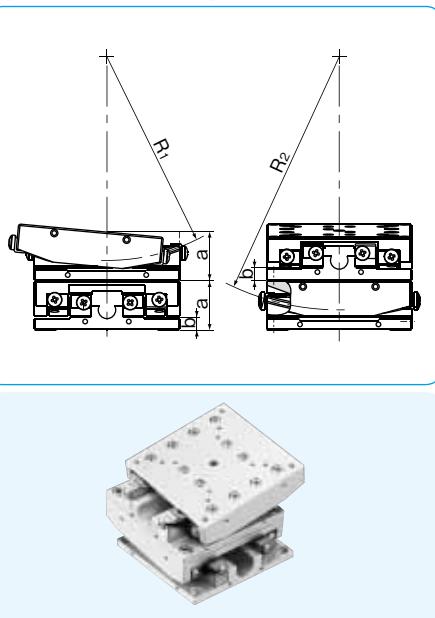

## RVF TYPE 2 AXES AND SPECIAL SPECIFICATIONS

When incorporating RVF type units onto two axes as illustrated in Figure G-40, adjust the height of one lifting axis as instructed in Table G-17. Then, adjust dimension b (the height of the installation surface of the a-curved tracking base) in Figure G-40 according to the table in order to obtain the identical rotation center for the two axes. In addition, requests can be made for custom specifications including table units fitted for two axes, non-standard lengths for curved tracking bases, the radius of rotation, the rotation range, and the number of rollers. Contact NB for further information.

## USE AND HANDLING PRECAUTIONS

### Lubrication

NB gonio ways are lubricated using lithium soap based grease prior to shipment, so they can be used immediately. Make sure to relubricate with a similar type of grease periodically according to the operating conditions. NB also provides low dust generation grease for the linear system. Please refer to page Eng-39 for further details.

### Dust Prevention

If a foreign matter, such as dust and dirt, enters the inside of the NB gonio way, it will deteriorate the accuracy and life of the system. A gonio way used in a harsh environment should be protected with a cover.

### Operating Environment

The recommended operating temperature range of the NB gonio way is  $-20^{\circ}\text{C}$  to  $110^{\circ}\text{C}$ .

### Adjustment

Inaccuracy in mounting surface or improper adjustment of preload will reduce the motion accuracy, resulting in skewing and shortening of gonio way life. The adjustment should be carried out carefully.

### Cage Slippage

For the NB Gonio Way, the cage can slip under high-speed motion, vertical application, unbalanced-loading, and vibrating conditions. It is recommended that the rotation range be set with sufficient margin and an excessive preload should be avoided. It is also recommended that the rails be cycled to perform the maximum stroke several times, so that the cage returns to its central position.

### End Pieces

End pieces are attached to each end of the NB gonio way to prevent removal of the curved roller cage. Do not use as a mechanical stopper.

### Careful Handling

Dropping the NB gonio way causes the rolling elements to make dents in the raceway surface. This will prevent smooth motion and will also affect accuracy. Be sure to handle the product with care.

### Use as a Set

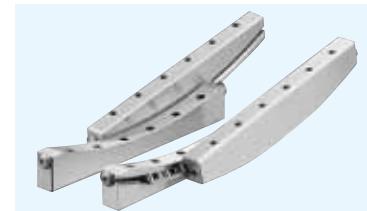

The accuracy of the rails has been matched within each set. Note that the accuracy will be affected when the rails of different sets are combined.

### Allowable Load

The allowable load is a load under which the sum of elastic deformation of the rolling element and the raceway in the contact area subject to the maximum contact stress is small enough to guarantee smooth rolling movement. When very smooth and highly accurate motion is required, make sure to use the product within the allowable load.

**ACTUATOR**

# ACTUATOR

NB's BG type is a compact single axis actuator which integrates a slide guide and precision ball screw. BG type offers compact dimensions and outperforms conventional positioning tables.

This is made possible by a unique "U" shaped guide rail and slide block which provides multiple functions of a guide block and a ball screw nut combined into a single unit. The "U" shaped guide rail offers high rigidity against bending moment. This structural feature allows for integrated framework of machinery or equipment and can be cantilevered. Additionally, the slide block contains 4 ball circuits which delivers high load capacity, high accuracy and high rigidity.

Figure H-1 Structure of BG type

## ADVANTAGES

### Adjustment Free

The integration of the slide guide and precision ball screw eliminates complex precision adjustment and reduces installation time dramatically.

### High Rigidity

"U" shaped guide rail provides very high rigidity despite its compact configuration and can be used for cantilevered application. (refer to page H-9)

### High Accuracy

BG type contains four ball circuits and four-point contact ball grooves which contribute to its high rigidity. The combination of precision ground guide rail, slide block and precision ball screw provides high positioning accuracy.

### Space Saving

In comparison to conventional positioning tables, the BG type allows for compact designs and dramatic space saving. The "U" shaped guide rail and integrated slide block and precision ball screw make this possible.

------	----------------

P△□	with positioning pin hole (※1)
-----	--------------------------------

G▲	with special grease option (※2)
----	---------------------------------

LB	with low temperature black chrome treatment (※3)
----	--

PNP	with PNP sensor
-----	-----------------

In case of multiple options, add + between each option.

Example: (PS+LB+PNP)

※1: △ is S, W or R (refer to page H-57)  
□ is R (refer to page H-57)

※2: ▲ is K, U, L or F (refer to page H-16)

Grease is applied to slide guide, ball screw, and angular bearings.  
※3: LB is applied to steel parts except for aluminum parts and radial bearings.

For BG15, LB is applied to steel parts except for the drive block, aluminum parts, and radial bearings.

Black chrome treatment is applied to the drive block.

## SPECIFICATIONS

BG Type is categorized as either high grade (H) or precision grade (P).

M<sub>2P</sub>, M<sub>2Y</sub> and M<sub>2R</sub> are the allowable static moments when 2 blocks are used in close contact.

\* Please consult with NB when using BG15, BG20 and BG26 series in the Precision grade with short and frequent stroke. (short stroke: BG1501=2mm or less, BG1502=4mm or less, BG2001=7mm or less, BG2005=25mm or less, BG2602=14mm or less and BG2605=25mm or less)

Short blocks are not available for BG3320.

Figure H-4 Direction of Moment

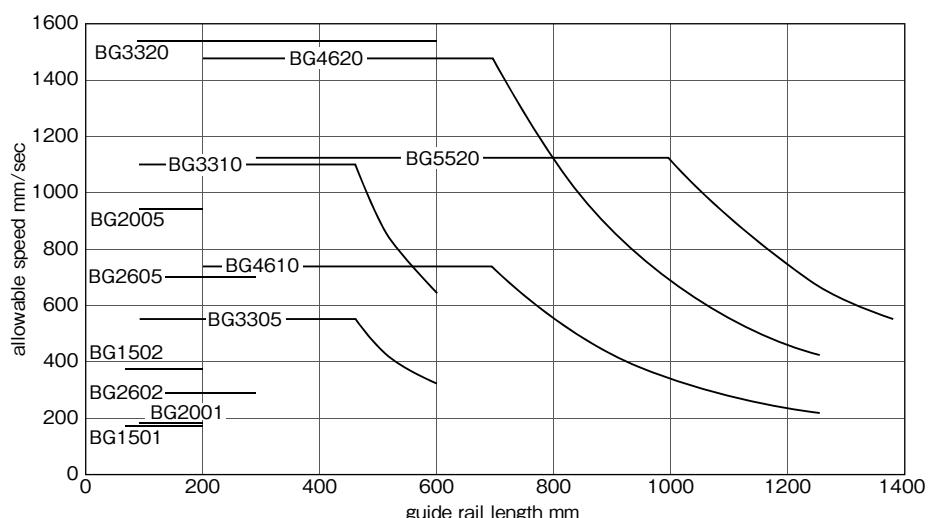

## ALLOWABLE SPEED

Allowable speed of BG type is subject to the type of motor and operating conditions. The speed may also be limited by the critical speed of the ball screw. Use caution when operating at high speeds or using long rails.

Table H-2 Allowable Speed

	1,380														

Above values are measured by using our selected motors.

\* Above specifications are based on using NB standard grease. Other grease may cause deviations.

The values in the parentheses are positioning repeatability when used with return pulley unit.

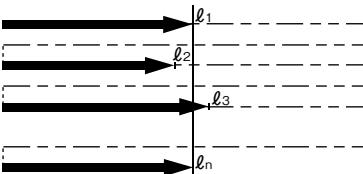

## Positioning Repeatability

After setting an arbitrary position, from one end, move the drive block to this position and measure the stop position. Repeat the positioning and measurement process 7 times with respect to the setting position at the midpoint and near both ends of travel. Take the maximum difference and divide it by 2, then indicate it with a positive and negative sign as the test result.

### Positioning Repeatability

$$= \pm \frac{1}{2} ((\text{maximum value of } \ell_n) - (\text{minimum value of } \ell_n))$$

Figure H-7 Positioning Repeatability

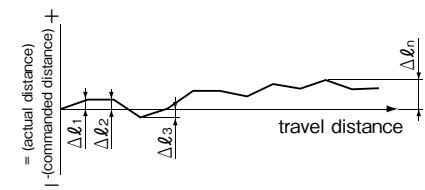

## Positioning Accuracy

Positioning is performed in one direction and the resulting position is set as the datum point. Take the difference between the actual travel distance and the commanded travel distance from the datum point. Continuing in the same direction (without returning to the start point) repeat this process randomly several times until nearing to the stroke limit. Express the accuracy by the absolute maximum difference.

$$\text{Positioning Accuracy} = (\Delta \ell_n)_{\max}$$

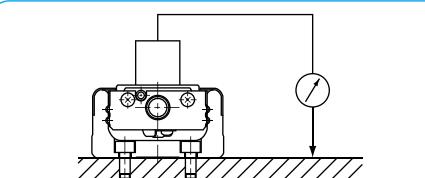

Figure H-8 Positioning Accuracy

## Running Parallelism B

After fixing the guide rail onto the surface plate, placing the dial test indicator on the center of the slide block and connecting the indicator probe onto the mounting surface, run the block over the entire travel distance. Take the maximum deviation in readings as the test result.

Figure H-9 Running Parallelism

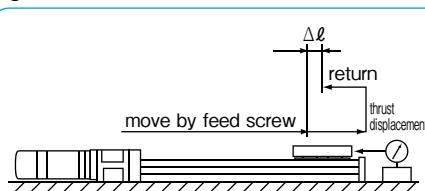

## Backlash

Using the feed screw to move the slide block a little, take the dial test indicator reading and make it the datum point. While in this position, thrust the block by a certain force in the same direction without using the feed screw. Release the thrust and read the return, then take the difference from the datum point. Repeat the same process at the midpoint and near both ends of travel. Take the maximum difference as the test result.

$$\text{Backlash} = \Delta \ell$$

Figure H-10 Backlash

## RATED LIFE

To obtain the rated life of the BG type, calculate the rated life of the guide portion, ball screw portion and support bearing portion. Use the minimum value as the rated life of the BG type.

### A. Life of Guide Portion

Use the following equation for calculating the rated life of guide portion.

$$L_g = \left( \frac{f_c}{f_w} \cdot \frac{C}{P_T} \right)^3 \cdot 50 \quad \dots \dots \dots (1)$$

$L_g$ : rated life (km)  $f_c$ : contact coefficient (refer to Table H-8)

$f_w$ : applied load coefficient (refer to Table H-9)

C: basic dynamic load rating (N)

$P_T$ : calculated load applied to one block (N)

#### A.1. Calculation of $P_T$

Before calculating the rated life using the equation (1), the calculated load applied to one block ( $P_T$ ) needs to be obtained in consideration of the moment load, etc. that will be actually applied. For rapidly-accelerating or short stroke motion,  $P_T$  needs to be calculated with acceleration taken into consideration. The calculation of this acceleration will be carried out for the mass applied to BG. Obtain the calculated load during uniform motion, acceleration, and deceleration, and use the average value of the three as  $P_T$ .

For the calculation of  $P_T$ , select an appropriate equation depending on the installation conditions of the guide.

It is also possible to calculate  $P_T$  without including the effect of acceleration by using the equation " $P_T = P_{TC}$ " (see the equations (2), (5), and (8)). In this case, however, the obtained value is a rough approximation, so a selection with sufficient margin is recommended.

Table H-8 Contact Coefficient ( $f_c$ )

number of blocks in close contact on one axis	contact coefficient ( $f_c$ )
1	1.0
2	0.81

Table H-9 Applied Load Coefficient ( $f_w$ )

operating conditions vibration, impact	velocity	applied load coefficient ( $f_w$ )
none	15m/min or less	1.0 ~ 1.5
low	60m/min or less	1.5 ~ 2.0
high	60m/min or more	2.0 ~ 3.5

Table H-10 Moment Equivalent Coefficient

	$E_p$ (E2p)	$E_y$ (E2y)	$E_r$ (E2r)
BG15**A	$2.82 \times 10^{-1}$	$2.37 \times 10^{-1}$	$9.35 \times 10^{-2}$

BG33**D	$3.09 \times 10^{-2}$	$2.59 \times 10^{-2}$	$2.27 \times 10^{-2}$
BG46**A	$8.39 \times 10^{-2}$	$7.04 \times 10^{-2}$	$3.17 \times 10^{-2}$
BG46**B	$1.56 \times 10^{-2}$	$1.31 \times 10^{-2}$	$1.59 \times 10^{-2}$
BG46**C	$1.39 \times 10^{-1}$	$1.17 \times 10^{-1}$	$3.17 \times 10^{-2}$
BG46**D	$2.15 \times 10^{-2}$	$1.81 \times 10^{-2}$	$1.59 \times 10^{-2}$
BG55**A	$6.80 \times 10^{-2}$	$5.71 \times 10^{-2}$	$2.74 \times 10^{-2}$
BG55**B	$1.35 \times 10^{-2}$	$1.14 \times 10^{-2}$	$1.37 \times 10^{-2}$

\*The E2 coefficient is for two blocks being used in close contact.

#### A.1.a. $P_T$ for Horizontal Move (Horizontal Mounting)

i) during uniform motion ( $P_{TC}$ )

$$P_{TC} = \frac{1}{n} \cdot W + E_p \cdot M_{pL} + E_y \cdot M_{yL} + E_r \cdot M_{rL} \quad \dots \dots \dots (2)$$

ii) during acceleration ( $P_{Ta}$ )

$$P_{Ta} = \frac{1}{n} \cdot W + E_p(M_{pL} + m \cdot a_s \cdot Z) + E_y(M_{yL} + m \cdot a_s \cdot X) + E_r \cdot M_{rL} \quad \dots \dots \dots (3)$$

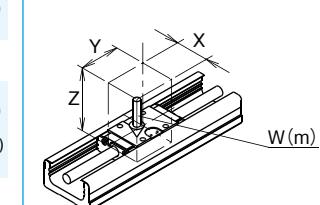

Note that the values of ( $M_{pL} + m \cdot a_s \cdot Z$ ) and ( $M_{yL} + m \cdot a_s \cdot X$ ) will be treated as 0 (zero) when the calculated value is negative.

iii) during deceleration ( $P_{Td}$ )

$$P_{Td} = \frac{1}{n} \cdot W + E_p(M_{pL} + m \cdot a_d \cdot Z) + E_y(M_{yL} + m \cdot a_d \cdot X) + E_r \cdot M_{rL} \quad \dots \dots \dots (4)$$

Note that the values of ( $M_{pL} + m \cdot a_d \cdot Z$ ) and ( $M_{yL} + m \cdot a_d \cdot X$ ) will be treated as 0 (zero) when the calculated value is negative.

Figure H-11

In case of load coming from different direction other than the direction shown in the drawing W(m), please contact NB.

$P_{TC}$ : calculated load applied to a block during uniform motion (N)  $P_{Ta}$ : calculated load applied to a block during accelerating (N)  $P_{Td}$ : calculated load applied to a block during decelerating (N) n: number of blocks of BG W: applied load (N) m: carrying mass (kg)

$a_s$ : acceleration during accelerating (m/sec<sup>2</sup>)  $a_d$ : acceleration during decelerating (m/sec<sup>2</sup>) (the negative value)

X: distance between the center of BG and the center of the carrying mass (mm)

Y: distance between the center of BG and the center of the carrying mass (mm)

Z: distance between the center of BG ball screw and the center of the carrying mass (mm)

$E_p$ : moment equivalent coefficient in the pitching direction (refer to Table H-10)

$E_y$ : moment equivalent coefficient in the yawing direction (refer to Table H-10)

$E_r$ : moment equivalent coefficient in the rolling direction (refer to Table H-10)

$M_{pL}$ : applied moment in the pitching direction (N · mm)  $M_{pL} = W \cdot Y$

$M_{yL}$ : applied moment in the yawing direction (N · mm)  $M_{yL} = 0$

$M_{rL}$ : applied moment in the rolling direction (N · mm)  $M_{rL} = W \cdot X$  \*Refer to Fig.H-4 for the direction of moment.

\*Refer to Fig.H-4 for the direction of moment.

#### A.1.b. $P_T$ for Horizontal Move (Wall Mounting)

i) during uniform motion ( $P_{TC}$ )

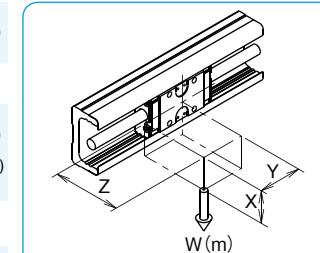

$$P_{TC} = \frac{1}{1.19 \cdot n} \cdot W + E_p \cdot M_{pL} + E_y \cdot M_{yL} + E_r \cdot M_{rL} \quad \dots \dots \dots (5)$$

ii) during acceleration ( $P_{Ta}$ )

$$P_{Ta} = \frac{1}{1.19 \cdot n} \cdot W + E_p(M_{pL} + m \cdot a_s \cdot Z) + E_y(M_{yL} + m \cdot a_s \cdot X) + E_r \cdot M_{rL} \quad \dots \dots \dots (6)$$

Note that the values of ( $M_{pL} + m \cdot a_s \cdot Z$ ) and ( $M_{yL} + m \cdot a_s \cdot X$ ) will be treated as 0 (zero) when the calculated value is negative.

Figure H-12

In case of load coming from different direction other than the direction shown in the drawing W(m), please contact NB.

$P_{TC}$ : calculated load applied to a block during uniform motion (N)  $P_{Ta}$ : calculated load applied to a block during accelerating (N)  $P_{Td}$ : calculated load applied to a block during decelerating (N) n: number of blocks of BG W: applied load (N) m: carrying mass (kg)

$a_s$ : acceleration during accelerating (m/sec<sup>2</sup>)  $a_d$ : acceleration during decelerating (m/sec<sup>2</sup>) (the negative value)

X: distance between the center of BG and the center of the carrying mass (mm)

Y: distance between the center of BG and the center of the carrying mass (mm)

Z: distance between the center of BG ball screw and the center of the carrying mass (mm)

$E_p$ : moment equivalent coefficient in the pitching direction (refer to Table H-10)  $E_y$ : moment equivalent coefficient in the yawing direction (refer to Table H-10)  $E_r$ : moment equivalent coefficient in the rolling direction (refer to Table H-10)

$M_{pL}$ : applied moment in the pitching direction (N · mm)  $M_{pL} = 0$

$M_{yL}$ : applied moment in the yawing direction (N · mm)  $M_{yL} = W \cdot Y$

$M_{rL}$ : applied moment in the rolling direction (N · mm)  $M_{rL} = W \cdot Z$  \*Refer to Fig. H-4 for the direction of moment.

### A.1.c. $P_T$ for Vertical Move

i) during uniform motion ( $P_{TC}$ )

$$P_{TC} = E_p \cdot M_{pL} + E_y \cdot M_{yL} + E_r \cdot M_{rL} \quad \dots \dots \dots (8)$$

ii) during acceleration ( $P_{Ta}$ )

$$P_{Ta} = E_p (M_{pL} + m \cdot a_a \cdot Z) + E_y (M_{yL} + m \cdot a_a \cdot X) + E_r \cdot M_{rL} \quad \dots \dots \dots (9)$$

Note that the values of  $(M_{pL} + m \cdot a_a \cdot Z)$  and  $(M_{yL} + m \cdot a_a \cdot X)$  will be treated as 0 (zero) when the calculated value is negative.

iii) during deceleration ( $P_{Td}$ )

$$P_{Td} = E_p (M_{pL} + m \cdot a_d \cdot Z) + E_y (M_{yL} + m \cdot a_d \cdot X) + E_r \cdot M_{rL} \quad \dots \dots \dots (10)$$

Note that the values of  $(M_{pL} + m \cdot a_d \cdot Z)$  and  $(M_{yL} + m \cdot a_d \cdot X)$  will be treated as 0 (zero) when the calculated value is negative.

$P_{TC}$ : calculated load applied to a block during uniform motion (N)  
 $P_{Ta}$ : calculated load applied to a block during accelerating (N)  
 $P_{Td}$ : calculated load applied to a block during decelerating (N)  
 $n$ : number of blocks of BG  
 $W$ : applied load (N)  
 $m$ : carrying mass (kg)  
 $a_a$ : acceleration during accelerating (m/sec<sup>2</sup>)  
 $a_d$ : acceleration during decelerating (m/sec<sup>2</sup>) (the negative value)  
 $X$ : distance between the center of BG and the center of the carrying mass (mm)  
 $Y$ : distance between the center of BG and the center of the carrying mass (mm)  
 $Z$ : distance between the center of BG ball screw and the center of the carrying mass (mm)  
 $E_p$ : moment equivalent coefficient in the pitching direction (refer to Table H-10)  
 $E_y$ : moment equivalent coefficient in the yawing direction (refer to Table H-10)  
 $E_r$ : moment equivalent coefficient in the rolling direction (refer to Table H-10)  
 $M_{pL}$ : applied moment in the pitching direction (N · mm)  $M_{pL} = W \cdot Z$   
 $M_{yL}$ : loaded moment in the yawing direction (N · mm)  $M_{yL} = W \cdot X$   
 $M_{rL}$ : applied moment in the rolling direction (N · mm)  $M_{rL} = 0$  \*Refer to Fig. H-4 for the direction of moment.

### A.1.d.

Obtain the calculated load applied to a block ( $P_T$ ) by calculating the average load of each motion using an appropriate equation among those shown above according to the application.

$$P_T = \frac{1}{\sqrt[3]{(S1+S2+S3)}} (P_{Ta}^3 \cdot S1 + P_{Tc}^3 \cdot S2 + P_{Td}^3 \cdot S3) \quad \dots \dots \dots (11)$$

$P_T$ : calculated load applied to one block (N)

S1: travel distance during acceleration (mm) (refer to Figure H-14)

S2: travel distance during uniform motion (mm) (refer to Figure H-14)

S3: travel distance during deceleration (mm) (refer to Figure H-14)

$P_{Ta}$ : calculated load applied to one block during accelerating (N); equation (3), (6), and (9)

$P_{Tc}$ : calculated load applied to one block during uniform motion (N); equation (2), (5), and (8)

$P_{Td}$ : calculated load applied to one block during decelerating (N); equation (4), (7), and (10)

## B. Life of Ball Screw and Support Bearing

The life of ball screw and support bearing can be calculated using a common equation, as shown below. Compare the dynamic load rating of the ball screw and the support bearing and apply smaller value for calculation.

$$L_a = \left( \frac{1}{f_w} \cdot \frac{C_a \text{ or } C_b}{P_a} \right)^3 \cdot \ell \quad \dots \dots \dots (12)$$

$L_a$ : rated life (km)  $f_w$ : applied load coefficient (refer to Table H-9)

$C_a$ : basic dynamic load rating of the ball screw (N)

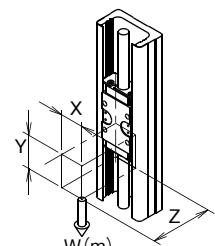

$C_b$ : basic dynamic load rating of the support bearing (N)

$P_a$ : axial load (N)  $\ell$ : ball screw lead (mm)

### B.1. Calculation of $P_a$

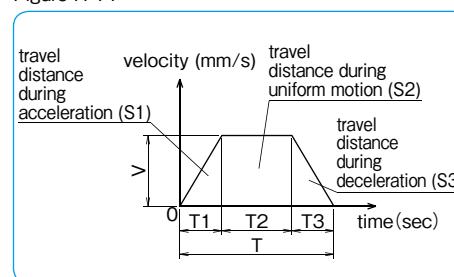

Before calculating the life using the equation (12), calculate  $P_a$  with acceleration taken into consideration. Calculate the load in each axial direction during uniform motion, acceleration, and deceleration and the obtained value is used as  $P_a$ .

Figure H-13

In case of load coming from different direction other than the direction shown in the drawing W(m), please contact NB.

Figure H-14

### B.1.a. For Horizontal Move

i) during uniform motion ( $P_{ac}$ )

$$P_{ac} = \mu \cdot W + F + f_b \cdot n \quad \dots \dots \dots (13)$$

ii) during acceleration ( $P_{aa}$ )

$$P_{aa} = \mu \cdot W + F + f_b \cdot n + (m + m_b \cdot n) a_a \quad \dots \dots \dots (14)$$

iii) during deceleration ( $P_{ad}$ )

$$P_{ad} = \mu \cdot W + F + f_b \cdot n + (m + m_b \cdot n) a_d \quad \dots \dots \dots (15)$$

Table H-11 Sliding Resistance ( $f_b$ ) of a Single Block (Seal Resistance)  
unit: N

	high grade (H)	precision grade (P)
BG15	0.8	1.8

### B.1.b. For Vertical Move

i) during uniform motion ( $P_{ac}$ )

$$P_{ac} = (m + m_b \cdot n) g + F + f_b \cdot n \quad \dots \dots \dots (16)$$

ii) during acceleration ( $P_{aa}$ )

$$P_{aa} = (m + m_b \cdot n) \cdot (g + a_a) + F + f_b \cdot n_a \quad \dots \dots \dots (17)$$

iii) during deceleration ( $P_{ad}$ )

$$P_{ad} = (m + m_b \cdot n) \cdot (g + a_d) + F + f_b \cdot n_d \quad \dots \dots \dots (18)$$

### B.1.c.

Obtain the average axial load ( $P_a$ ) using an appropriate formula among those shown above depending on the application.

$$P_a = \frac{1}{\sqrt[3]{(S1+S2+S3)}} (P_{aa}^3 \cdot S1 + P_{ac}^3 \cdot S2 + P_{ad}^3 \cdot S3) \quad \dots \dots \dots (19)$$

$P_a$ : average axial load (N)

S1: travel distance during acceleration (mm) (refer to Table H-14)

S2: travel distance during uniform motion (mm) (refer to Table H-14)

S3: travel distance during deceleration (mm) (refer to Table H-14)

$P_{aa}$ : axial load during accelerating (N); formulas (14) and (17)

$P_{ac}$ : axial load during uniform motion (N); formulas (13) and (16)

$P_{ad}$ : axial load during decelerating (N); formulas (15) and (18)

## LUBRICATION

● BG type contains a lithium soap based grease. (Multemp PS No.2, KYODO YUSHI) Apply similar type of grease for the lubrication as required depending on the operating conditions.

● Use the grease fitting to lubricate the slide block. For ball screw portion apply grease directly to the surface of screw shaft.

※ BG15 slide block has φ2mm oil holes instead of grease fitting.

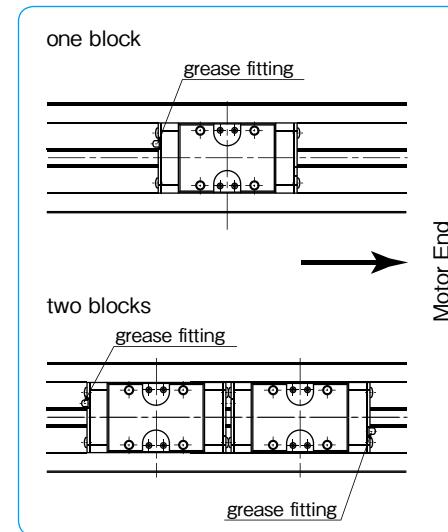

● Unless otherwise instructed, a grease fitting is located as shown in Figure H-15.

● The grease can be changed to a high function type by adding a special grease option at the end of the part number. Please refer to Table H-12 for the grease type. Also refer to page Eng-39 for further details.

Table H-12 Applicable Grease

grease option	features	product name
none (standard)	—	Multemp PS No.2 (KYODO YUSHI)
GK	urea-type low dust generation grease	K Grease
GU	urea-type low dust generation grease; low sliding resistance	KGU Grease
GL	lithium-type low dust generation grease	KGL Grease
GF	urea-type anti-fretting grease	KGF Grease

Figure H-15 Location of Grease Fitting

## OPERATING TEMPERATURE

● Resin parts are incorporated in the BG type. Please avoid using BG type above 80°C. Please use the product at 55°C or lower when sensor/bellows are optioned.

## USE AND HANDLING PRECAUTIONS

- Please handle as a precision component and avoid excessive vibration or shock.
- Rough handling will affect the smooth motion and reduce the precision performance and life time.
- DO NOT DISASSEMBLE. The accuracy of BG type is preadjusted when assembled.
- Please allow for extra stroke length. If the guide block repeatedly collides with damper, it may cause damage.
- Please never touch the area at both stroke ends during operation. There is a danger for the fingers to be caught at the stroke end. Please pay enough attention to the guide rail area even when not in operation, there is a danger for the fingers to be injured by the dust cover.
- Depending upon the operating environment, dust and foreign particles may contaminate BG type and disrupt the ball circulation and precision performance.

## MOTOR BRACKET CONFIGURATIONS & APPLICABLE MOTORS

NB provides optional motor brackets to easily install most popular motors.

Table H-13 Applicable Motors

should be set within the coupling's allowable  
torque.

**EXPOSED BRACKET RO**

The ball screw shaft end is exposed with the exposed bracket R0 type.  
Please fabricate an original bracket in case the standard brackets are not applicable.

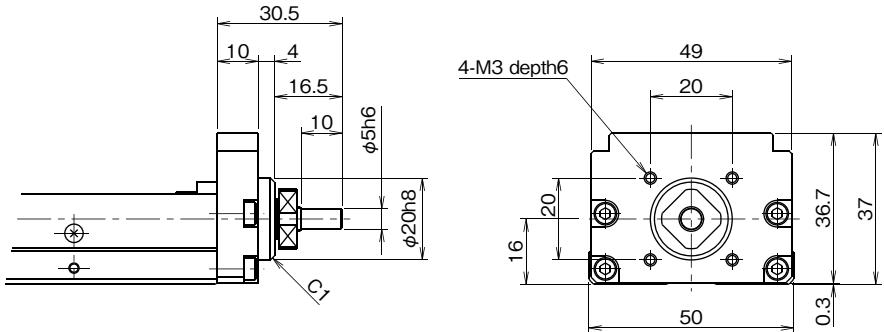

**BG15 Exposed Bracket R0**

- Applicable with cover and with sensors.
- Mass is 0.04kg less than the mass in Table H-3 on page H-7.

**BG20 Exposed Bracket R0**

- Applicable with cover and with sensors.
- Mass is 0.04kg less than the mass in Table H-3 on page H-7.

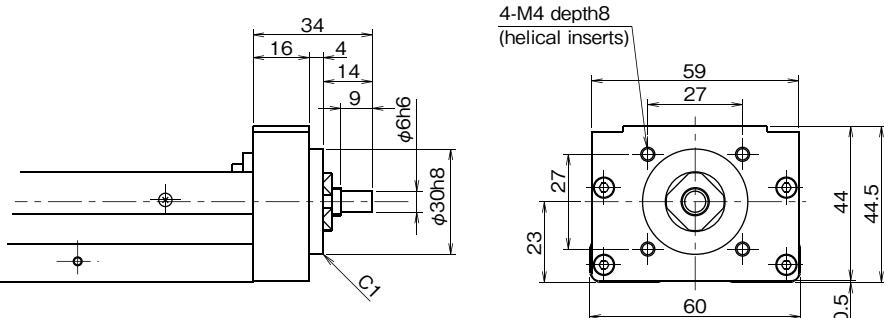

BG26 Exposed Bracket RO

1. Applicable with cover and with sensors.

2. Mass is 0.08kg less than the mass in Table H-3 on page H-7.

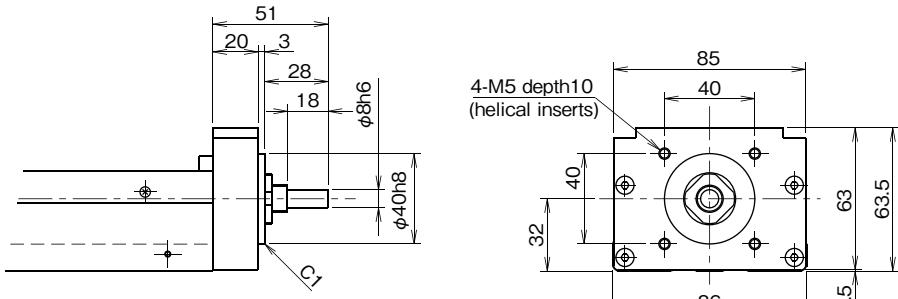

BG33 Exposed Bracket RO

1. Applicable with cover and with sensors.

2. Mass is 0.1kg less than the mass in Table H-3 on page H-7.

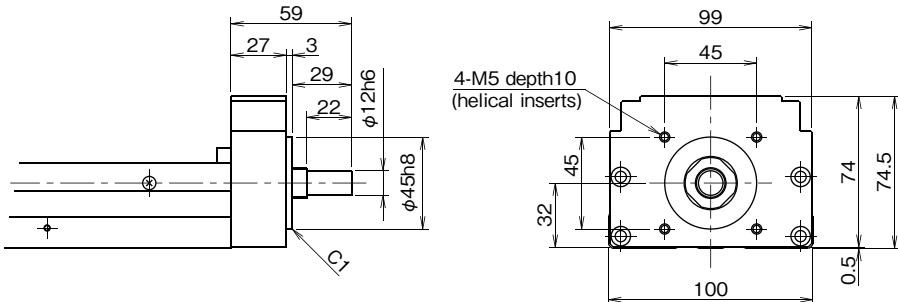

BG46 Exposed Bracket RO

1. Applicable with cover and with sensors.

2. Mass is 0.3kg less than the mass in Table H-3 on page H-7.

BG55 Exposed Bracket RO

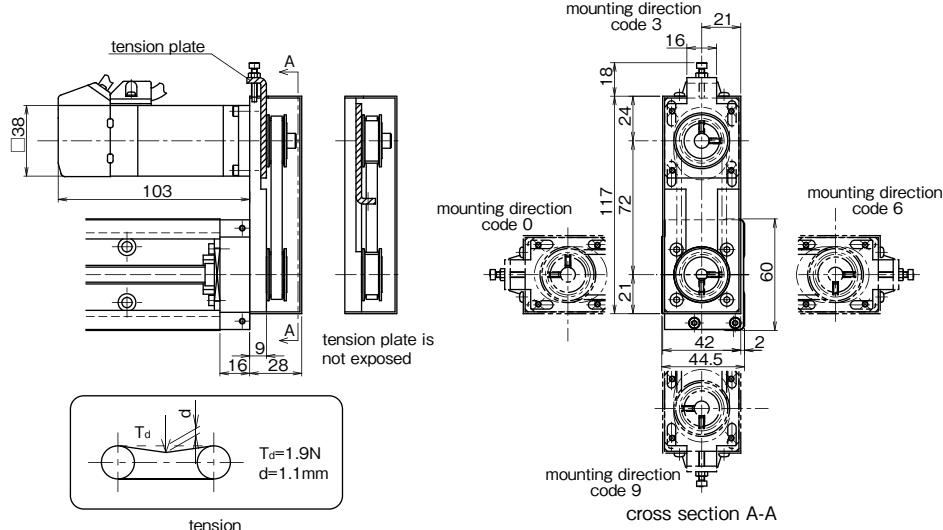

1. Applicable with cover and with sensors.

2. Mass is 0.3kg less than the mass in Table H-3 on page H-7.

## RETURN PULLEY UNIT

Return pulley units in which a motor is connected with a timing belt are available for BG type. Its return structure allows the reduction of total length (available for BG33 and BG46).

### BG33 Return Pulley Unit

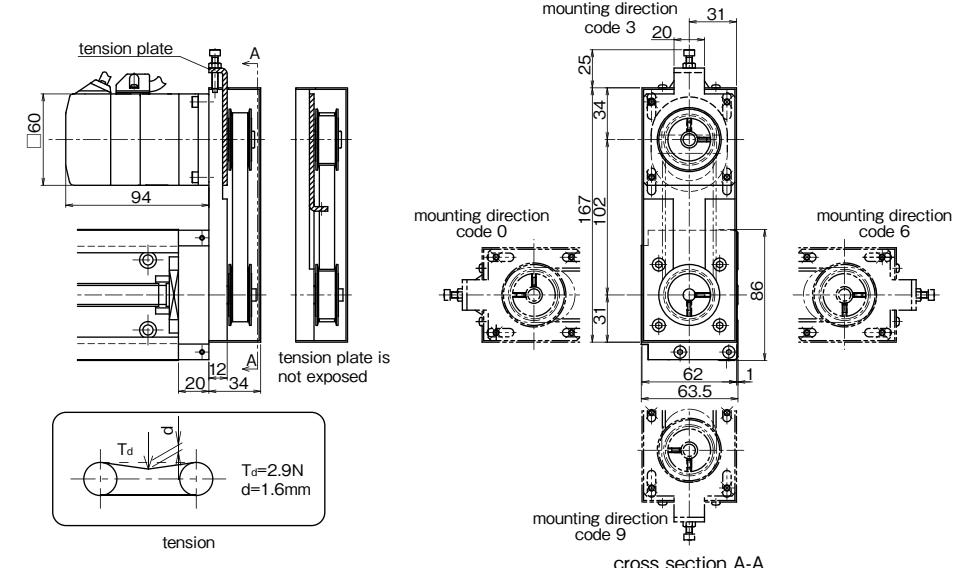

- This drawing shows RA for MSMA01(Panasonic).
- Installation position of Pulley Unit can be selected at 90° intervals (mounting direction code).
- Applicable with cover and with sensors.
- Tension plate can be built in and is not exposed. (not applicable to RC)
- Mass is added 0.2kg to the mass in Table H-3, page H-7.
- Inertia is added  $2.22 \times 10^{-6}\text{kg} \cdot \text{m}^2$  to the value of Table H-5, page H-8. (motor inertia not included)
- Part number structure BG33\*\*\*-\*-\*-\*/\* / ☆☆□

RC	5 PHASE STEPPING MOTOR	□60 SERIES

Please contact NB for other stepper motors.

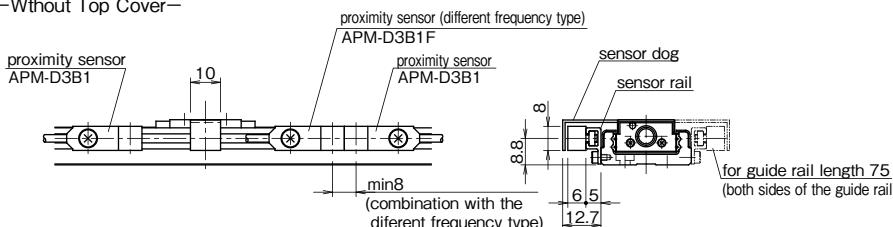

## SENSOR

Photomicro sensor or proximity sensor can be attached to the BG actuator with our optional sensor-mounting rail (the same length as the guide rail length). Tapped holes are machined on both sides of the guide rail, allowing attachment of sensor to either side. Standard positioning (without special instruction from customer) would be to the left of the motor mount end. Sensor option includes the items that are listed below.

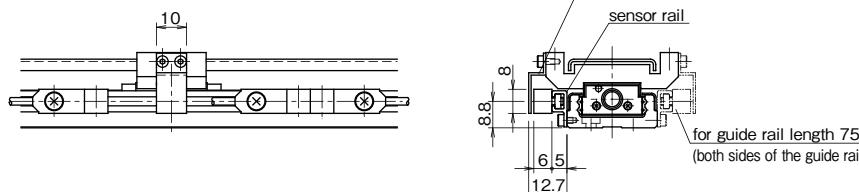

### BG15

## PNP Sensor

For the BG type sensors can be changed to the PNP type by adding a sensor option code "PNP" at the end of the part number.

Refer to Table H-16 for the model number of PNP type sensors.

Table H-16 Sensor Type

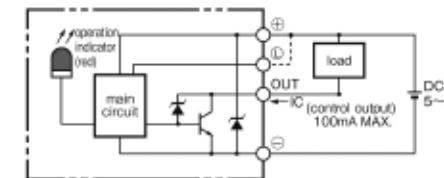

sensor code	sensor type	applicable model type	standard specification	PNP specification model type
S	slim-type photomicro sensor	BG33, BG46, BG55	EE-SX674	EE-SX674P
	compact photomicro sensor	BG20, BG26	PM-L24	PM-L24P
H	close contact capable photomicro sensor	BG33, BG46, BG55	EE-SX671	EE-SX671P
K	proximity sensor	all model types	APM-D3B1	APM-D3E1
	proximity sensor (different frequency type)	all model types	APM-D3B1F	APM-D3E1F

## SENSOR SPECIFICATIONS

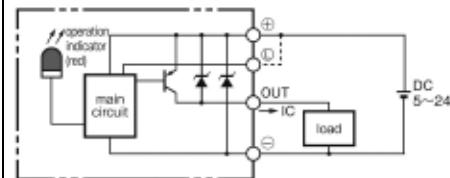

slim-type, close contact capable photomicro sensor (symbol: S,H)/ OMRON CORPORATION

type	NPN TYPE	EE-SX674	EE-SX671
	PNP TYPE	EE-SX674P	EE-SX671P
sensing distance		5mm (slot width)	
standard sensing object		opaque: 2×0.8mm min.	
differential travel		0.025mm	
power supply voltage		5 to 24 VDC ±10%, ripple(P-P): 10% max.	
current consumption		35mA max. (NPN), 30 mA max.(PNP)	
control output	NPN TYPE	NPN open collector output models: At 5 to 24 VDC: 100-mA load current (Ic) with a residual voltage of 0.8V max.40-mA load current (Ic) with a residual voltage of 0.4V max.	
	PNP TYPE	PNP open collector output models: At 5 to 24 VDC: 50-mA load current (Ic) with a residual voltage of 1.3V max.	
output operation		Dark-On (+, L terminal open-circuit), Light-On (+, L terminal short-circuit)	
response frequency		1kHz max. (3kHz average)	
operation indicator		operation indicator (red) lit with incident	
ambient illumination (on receiver lens)		fluorescent light: 1000 lx max.	
ambient temperature		operating: -25 to 55°C storage: -30 to 80°C	
ambient humidity		operating: 5 to 85%RH storage: 5 to 95%RH	
vibration resistance		destruction: 20 to 2000Hz, (with peak acceleration of 100m/s <sup>2</sup> ) 1.5mm double amplitude for 2hrs (with 4-minute cycles) each in X,Y, and Z directions	
shock resistance		destruction: 500m/s <sup>2</sup> for 3 times each in X,Y, and Z directions	
degree of protection		IEC60529 IP50	
connection method		connector type (direct soldering possible)	
weight		approx. 3g	
material	case	Polybutylene phthalate (PBT)	
	cover		
	emitter/receiver	Polycarbonate (PC)

Please read the specifications and precautions of the manufacturer's catalog.

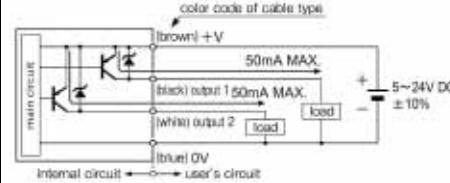

## compact photomicro sensor (symbol: S) / Panasonic Electric Works SUNX Co.,Ltd.

type	NPN TYPE	PM-L24
	PNP TYPE	PM-L24P
sensing range		5mm (fixed)
minimum sensing object		0.8×1.8mm min. opaque
hysteresis		0.05mm or less
repeatability		0.03mm or less
supply voltage		5 to 24 VDC ±10%, ripple(P-P) 10% or less
current consumption		15mA or less
output	NPN TYPE	NPN open-collector transistor maximum sink current: 50mA, applied voltage: 30VDC or less (between output and 0V) residual voltage: 0.7V or less (at 50mA sink current) 0.4V or less (at 16mA sink current)
	PNP TYPE	maximum source current: 50mA, applied voltage: 30VDC or less (between output and +V) residual voltage: 0.7V or less (at 50mA sink current) 0.4V or less (at 16mA sink current)
output operation		Incorporated with 2 outputs: Light-ON/Dark-ON
response time		under light received condition: 20μs or less under light interrupted condition: 100μs or less (response frequency: 1kHz or more)
operation indicator		vermillion LED (lights up under light received condition)
ambient illuminance		fluorescent light: 1000lx at the light-receiving face
ambient temperature		operating: -25 to 55°C (No dew condensation or icing allowed.) storage: -30 to 80°C
ambient humidity		35 to 85% RH storage: 35 to 85%RH
voltage withstandability		1000V AC for one min. between all supply terminals connected together and enclosure
insulation resistance		50MΩ, or more, with 250V DC megger between all supply terminals connected together and enclosure
vibration resistance		10 to 2,000Hz frequency, 1.5mm amplitude in X, Y, and Z directions for two hours each
shock resistance		15,000m/s <sup>2</sup> acceleration (1,500 G approx.) in X, Y, and Z directions for three times each
cable		0.09mm <sup>2</sup> 4-core cabtyre cable 1m long
weight		approx. 10g
material	case	Polybutylene phthalate (PBT)
	cover	Polycarbonate

PNP TYPE CIRCUIT DIAGRAM

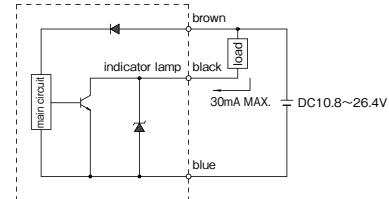

Please read the specifications and precautions of the manufacturer's catalog.

## BELLOWS

BG type can be specified with a cover or bellows for dust prevention. Bellows are securely fixed for various installation methods in positioning and directions. Sensor for bellows is limited to K (proximity sensor) type only, which is pre-installed at proper positions. Please pay attention to the stroke limit of BG with bellows that is shorter than the standard stroke limit.

### - Position of Sensor Cable Outlet -

The positions of the outlet for sensor cables can be selected as Figure H-16 shows.

Figure H-16 Position of Sensor Cable Outlet

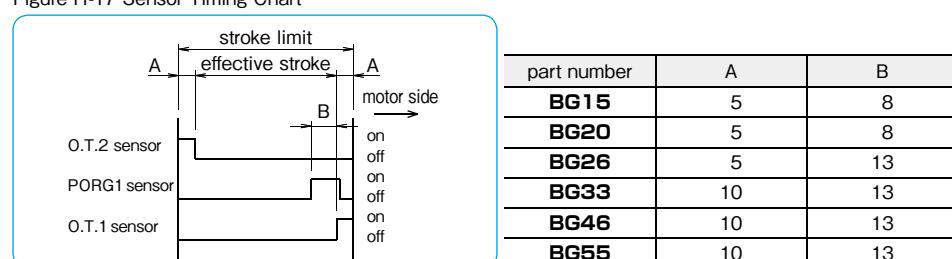

### part number structure for bellows

1. J (for the first symbol)
2. Specification of the position of the sensor cable outlet  
Please select the motor side or the housing side.  
M: motor side E: housing side (end plate side)
3. Specification of the position of the sensor rail  
Please select the right hand or the left hand.  
R: on the right from the motor side  
L: on the left from the motor side  
※N for BG15, 20, and 26 since the sensors are mounted on both the right and left hand.
4. JNN for without sensors
5. Sensor type is K (proximity sensor) type only (APM-D3 series: YAMATAKE CORPORATION).

### - Sensor Timing Chart -

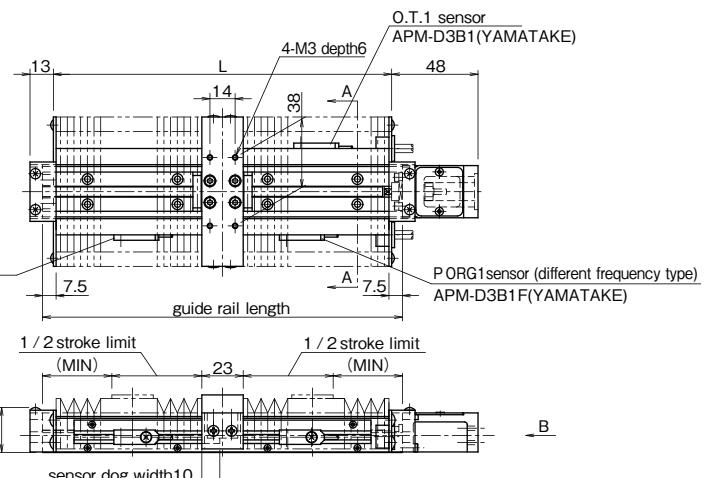

The following chart shows the standard sensor arrangement.

Figure H-17 Sensor Timing Chart

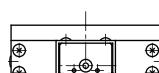

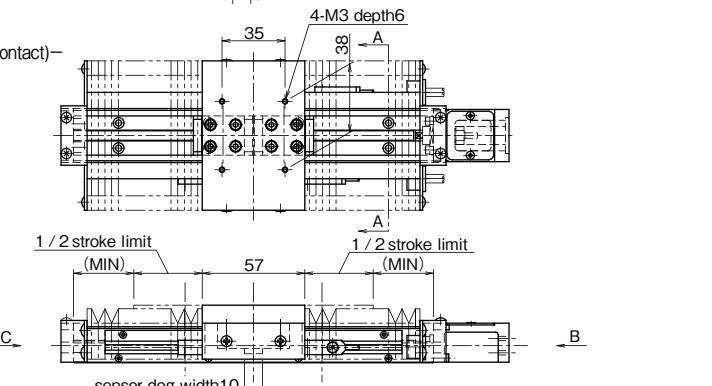

## BG15A, B

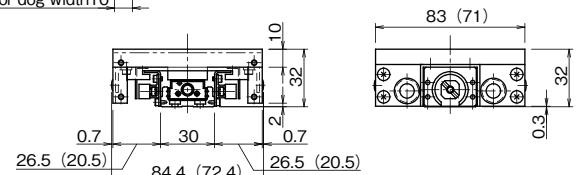

-1 long block-

1,380	1,368	1,070	1,050	107.5	969	949

## POSITIONING PIN HOLE

For the BG type, positioning pin holes can be provided on the slide block and sub table by adding the option code "PS" or "PW" in the end of the part number.

The option code "PR" is used to provide the guide rail with positioning pin holes.

When positioning pin holes are necessary on both the slide block/sub table and guide rail, please add the option code "PSR" or "PWR" as shown in Table H-17.

Table H-17 Option Code for Positioning Pin Hole

pin hole	slide block		
	PS	PW	none
guide rail	PR	PSR	PWR
none	PS	PW	none

## Positioning Pin Hole for Slide Block and Sub Table

It is useful when exacting reassembly positioning is required. In case of two blocks used, both blocks are processed.

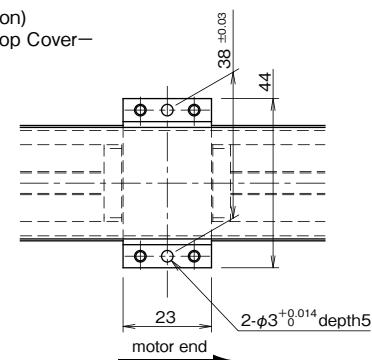

When the code "PS" is added, the drilling is processed only on the mounting surface(slide block or sub table). When the code "PW" is specified for a BG with a top cover (except for BG15), the slide block and sub table are connected by the straight pins at the location where the "PS" option specifies on the slide block.

Note that NB does not supply straight pins for the "PS" option.

## BG15A,B

(PS Option)

—With Top Cover—

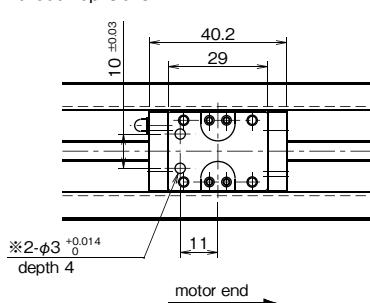

※Please contact NB for the without-top-cover option or the "PW" option.

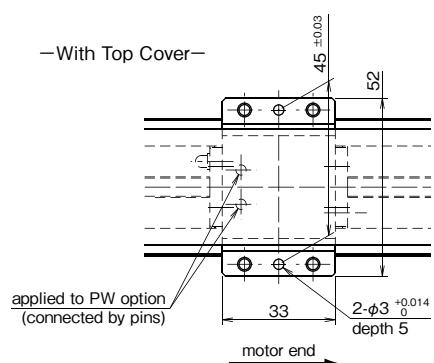

**BG20A, B**

(PS Option)

—Without Top Cover—

—With Top Cover—

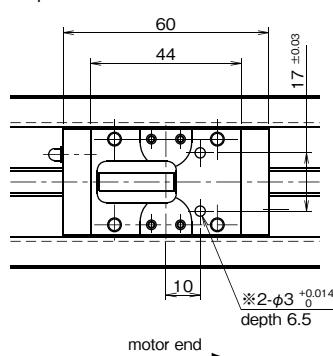

※For some cases, a shallow counterbore of  $\phi 4$  will be machined at the hole area with  
"※" to remove a hardened layer.

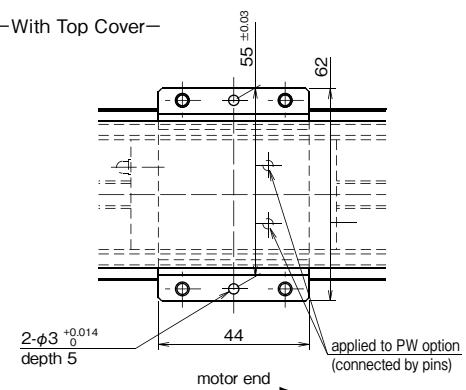

**BG26A, B**

(PS Option)

—Without Top Cover—

—With Top Cover—

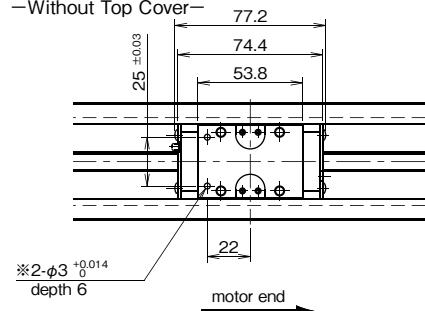

※For some cases, a shallow counterbore of  $\phi 4$  will be machined at the hole area with  
"※" to remove a hardened layer.

## BG55A, B

(PS Option)

-Without Top Cover-

-With Top Cover-

※For some cases, a shallow counterbore of Ø5 will be machined at the hole area with "※" to remove a hardened layer.

## POSITIONING PIN HOLE FOR GUIDE RAIL

It is useful to use positioning pin holes on the guide rail when exacting reassembly positioning is required. After the insertion of the straight pins in the BG guide rail base, the pins might interfere with the slide block. In the positioning process, please consider the BG base thickness. The length of the pin in the BG base shall be shorter than the BG base thickness. Please make sure that the pins shall not interfere with the slide block. Table H-18 shows the pin length in the BG base. Note that NB does not supply straight pins for the guide rail. (Parallel pin type A is recommended.)

Figure H-18 Positioning Pin Hole Location

# SLIDE SCREW

SLIDE SCREW

# SLIDE SCREW

The NB slide screw converts rotational motion into linear motion by utilizing the friction between radial ball bearings and a shaft. This simple mechanism eases maintenance and installation work. The slide screw is most commonly used as transport devices in many types of machines, and is not intended for accurate positioning requirements.

## STRUCTURE AND ADVANTAGES

The NB slide screw consists of two aluminum blocks, each with three radial ball bearings with a fixed angle between them. A round shaft is inserted between the two blocks, and its rotation produces linear motion determined by the contact angle between the shaft and the bearings. For variable loads, the thrust is adjusted by turning the spring loaded thrust adjustment bolts.

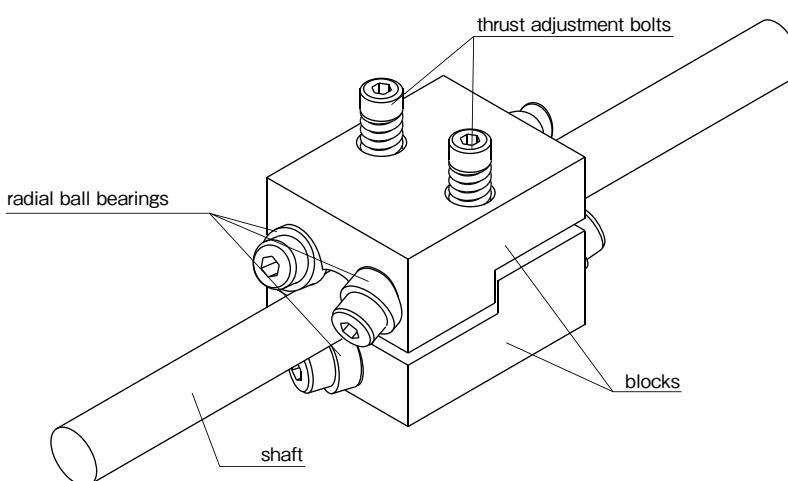

### Linear Motion on Round-shaft

The NB slide screw is suitable for long-stroke applications using a standard linear shaft.

### High Machine Efficiency

The slide screw utilizes the rotational motion of the bearings and drive shaft to achieve machine efficiency as high as 90%.

Figure I-1 Structure of NB Slide Screw

## SELECTION METHOD

### Required Thrust

Tightening of the bolts creates a thrust force by pushing the bearings against the shaft. This results in a constant force being applied to the bearings regardless of the load.

The thrust should not be greater than required force in the application.

For the horizontal application, the frictional resistance is calculated by the following equation.

$$F_1 = \mu \cdot g \cdot W \quad \dots \dots \dots \quad (1)$$

$F_1$ : frictional resistance (N)  $\mu$ : friction coefficient  
 $W$ : mass of work (kg)  
 $g$ : gravitational acceleration (9.8 m/sec<sup>2</sup>)

A sufficient safety margin should be achieved by setting  $\mu = 0.01$ . Also, the inertia at starting and stopping should be taken into consideration.

$$F_2 = W \frac{dv}{dt} \quad \dots \dots \dots \quad (2)$$

$F_2$ : inertia (N)  $W$ : mass of work (kg)  
 $dv/dt$ : acceleration (9.8m/sec<sup>2</sup>)

Therefore, the required thrust is its maximum at starting point due to the combination of frictional resistance and inertia.

$$F = F_1 + F_2 \quad \dots \dots \dots \quad (3)$$

$F$ : thrust (N)  $F_1$ : frictional resistance (N)  $F_2$ : inertia (N)

### Rated Life

The rated life is expressed in terms of the number of revolutions of the drive shaft by Equation (4). The corresponding total travel distance and life time are given in Equations (5) and (6) respectively.

Rated life

$$L = \left( \frac{C_F}{F} \right)^3 \cdot 10^6 \quad \dots \dots \dots \quad (4)$$

Total travel distance

$$L_s = \frac{L \cdot l}{10^6} \quad \dots \dots \dots \quad (5)$$

Life time

$$L_h = \frac{L}{60 \cdot n} \quad \dots \dots \dots \quad (6)$$

$L$ : rated life (rev)  $C_F$ : basic dynamic load rating (thrust) (N)

$F$ : thrust (N)  $L_s$ : travel life (km)  $l$ : lead (mm)

$L_h$ : life time (hr)  $n$ : revolutions per min (rpm)

Table I-1 Basic Dynamic Load Rating (Thrust)

part number	C:basic dynamic load rating (thrust) (N)
SS 6	98
SS 8	294
SS10	441
SS12	588
SS13	588
SS16	784
SS20	1,080
SS25	1,470
SS30	2,160

## Allowable Rotational Speed

When the rotational speed is increased and approaches the shaft resonant frequency, the shaft is disabled from further operation. This speed is called the critical speed and can be obtained by the following equation. In order to leave a sufficient safety margin, the maximum operating speed should be set at about 80% of the calculated value.

$$N_c = \frac{60\lambda^2}{2\pi L^2} \cdot \sqrt{\frac{EI \times 10^3}{\gamma A}} \quad \dots \dots \dots \quad (7)$$

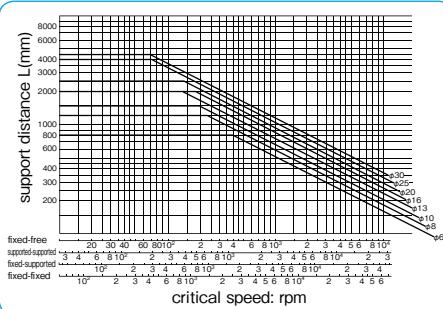

Nc: critical speed (rpm)  
E: modulus of direct elasticity (N/mm<sup>2</sup>)  
 $\gamma$ : density (kg/mm<sup>3</sup>)  
 $\lambda$ : installation coefficient (refer to Figure I-3)  
L: support distance (mm)  
I: geometrical moment of inertia (mm<sup>4</sup>)  
A: cross-sectional area of the shaft (mm<sup>2</sup>)

If modulus of direct elasticity is  $2.06 \times 10^5$  N/mm<sup>2</sup> and density is  $7.85 \times 10^{-6}$  kg/mm<sup>3</sup>, the critical speed for a solid shaft is:

$$N_c = 12.2 \cdot \frac{\lambda^2}{L^2} D \times 10^6 \quad \dots \dots \dots \quad (8)$$

Nc: critical speed (rpm)  
 $\lambda$ : installation coefficient (refer to Figure I-3)  
L: support distance (mm) D: shaft diameter (mm)

Figure I-2 Critical Speed and Support Distance

## INSTALLATION

1. Clean dust from drive shaft.
2. Place shaft between upper and lower blocks. Lightly tighten thrust adjustment bolts until the clearance between the shaft and the bearings diminishes.
3. Temporarily attach the slide screw to the table.
4. Adjust the parallelism between the slide screw and the linear motion guides by manually moving the table back and forth. Fix the shaft accurately after the required parallelism is achieved.

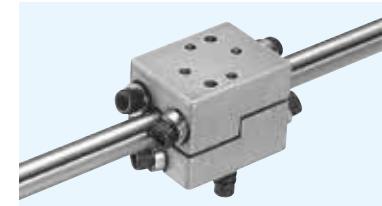

## USE AND HANDLING PRECAUTIONS

- It is recommended to use a heat-treated ground shaft such as NB shaft to prevent wear and to obtain smooth motion. (refer to page F-2)
- Since the slide screw utilizes the friction between the bearings and the shaft, the lead varies due to the effect of load variation, movement direction, and shaft conditions. Highly accurate positioning can be obtained by attaching a linear scale to the table.
- If the slide screw and linear motion guides are not parallel, an unbalanced load will be applied to the slide screw. Exercise care in controlling the parallelism.

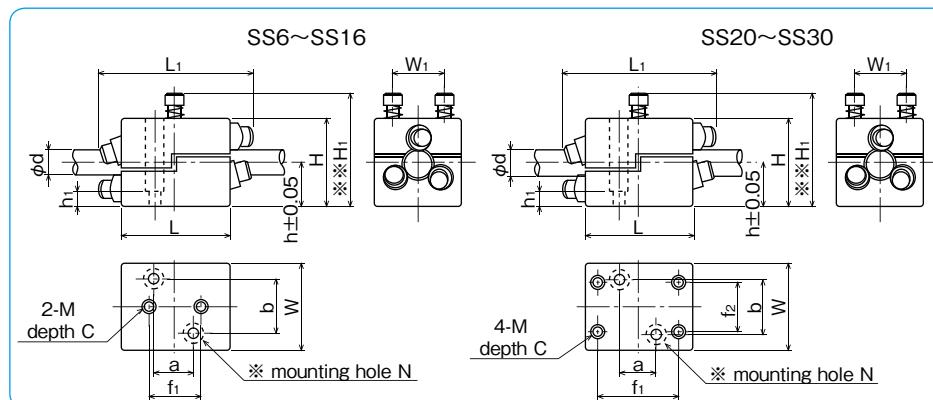

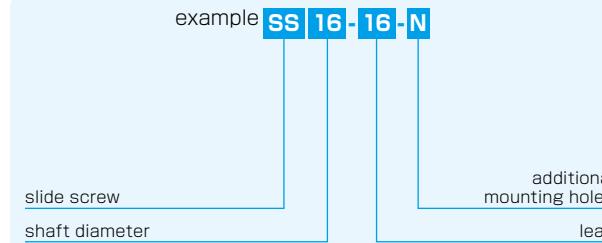

## SPECIAL REQUIREMENTS

NB can fabricate slide screws to meet special requirements, including screws with a special lead or a reverse lead. Contact NB for further information.

# **TECHNICAL REFERENCE**

## DEFINITIONS AND DESIGNATIONS OF GEOMETRICAL DEVIATIONS (JIS B0621)

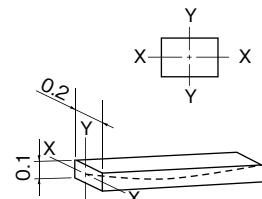

## TOLERANCING OF FORM, ORIENTATION, LOCATION AND RUN-OUT (JIS B0021)

**STRAIGHTNESS** Straightness indicates the degree of deviation of a straight portion from the geometrical straight line.

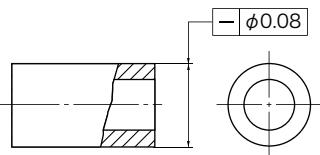

Straightness of two directions perpendicular to each other (Axis of a rectangular parallelepiped)

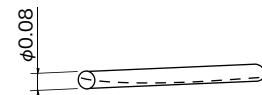

Space inside the prism enclosed by two pairs of parallel planes with intervals of 0.2mm and 0.1mm in the directions of indicated arrows

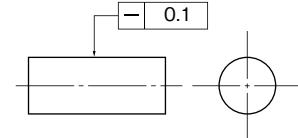

Straightness with no direction defined (Axis of a cylinder)

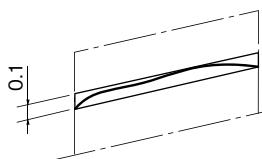

Space inside a cylinder with a diameter of 0.08mm

Straightness of a surface element (Generatrix of a cylinder)

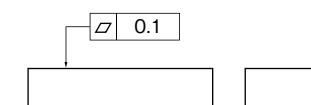

Space between a pair of parallel straight lines with an interval of 0.1mm on an arbitrary plane including the axis

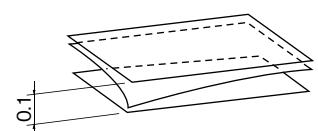

**FLATNESS** Flatness indicates the degree of deviation of a flat portion from the geometrical plane.

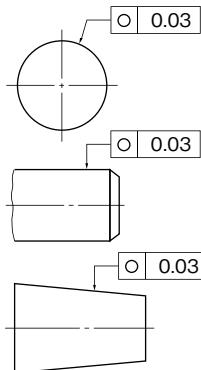

General flatness

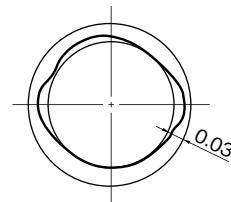

Space between a pair of parallel planes with an interval of 0.1mm

**CIRCULARITY**

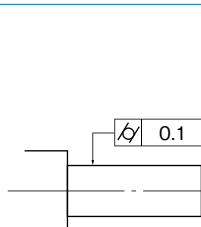

Circularity indicates the degree of deviation of a circular portion from the geometrical circle.

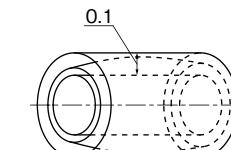

Space between two concentric circles with a radius difference of 0.03mm. Applicable to an arbitrary cross section perpendicular to the axis.

**CYLINDRICITY**

Cylindricity indicates the degree of deviation of a cylindrical portion from the geometrical cylindrical surface.

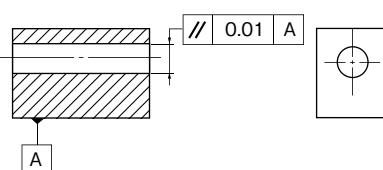

Space between two concentric cylinders with a radius difference of 0.1mm

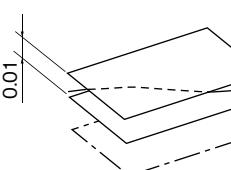

**PARALLELISM**

Parallelism assumes a combination of two straight portions, a straight portion and a flat portion, or two flat portions which must be parallel to each other. Parallelism indicates, with one of the two portions as a reference, the degree of deviation of the other straight or flat portion from the geometrical straight line or plane parallel to the reference straight line or plane.

Parallelism of a straight portion with respect to the reference plane (Axis of a hole)

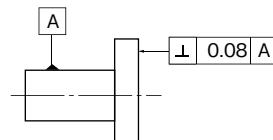

Space between two parallel planes with an interval of 0.01mm, parallel to the reference plane

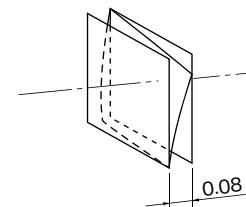

**PERPENDICULARITY**

Perpendicularity assumes a combination of two straight portions, a straight portion and a flat portion, or two flat portions which must be perpendicular to each other. Perpendicularity indicates, with one of the two portions as a reference, the degree of deviation of the other straight or flat portion from the geometrical straight line or plane.

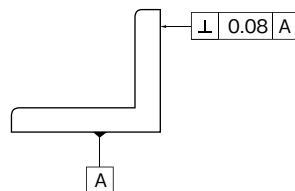

Perpendicularity of a flat portion with respect to the reference straight line (with the axis of a cylinder as a reference)

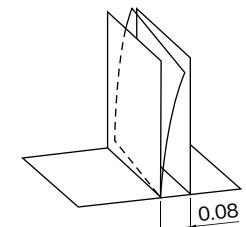

Space between two parallel planes with an interval of 0.08mm, perpendicular to the reference straight line

Perpendicularity of a flat portion with respect to the reference plane

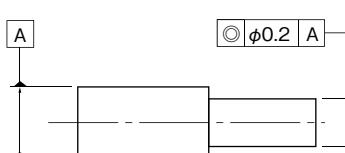

Space between two parallel planes with an interval of 0.08mm, perpendicular to the reference plane

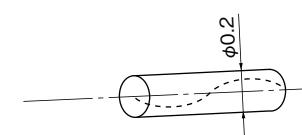

**CONCENTRICITY**

Concentricity indicates the degree of deviation from the axis which must be on the same straight line as the reference axis.

Concentricity of a cylindrical portion

Space inside a cylinder with a diameter of 0.2mm, concentric with the reference axis
