

Reliance Standard & Customised Components

Quality System

Reliance operations are controlled by a quality management system approved to BS EN ISO 9001.

Standard products and assemblies

Accurate positioning from modifiable standards for instrumentation, measurement and light actuation applications.

Bearings and spacers

A wide range of stainless steel, bronze and plastic bearings, stainless steel spacers and pre-loaded washers available.

Stepper motors

A range of all in one drive servo systems. An intelligent driver with a 32-bit RISC CPU, a magnetic encoder and power management all built onto the motor.

Linear products

Precision linear components which include, leadscrews, slideways, linear bearings and shafting.

Product Index

A general overview of Reliance's complete product range is available in the Reliance index brochure, or on the Reliance website at: **www.reliance.co.uk**

The couplings featured in this brochure have been carefully selected to accommodate varying degrees of shaft misalignment whilst offering minimum distortion of rotation.

No one coupling provides a universal solution but the selection table below summarises the salient performance features, for ease of comparison.

Full details for each coupling can be found on the product pages.

Reli-a-Flex[™]

The Reli-a-Flex[™] coupling, specifically designed and manufactured by Reliance to:

- Improve system accuracy The Reli-a-Flex[™] coupling provides excellent kinematic transfer of motion with high torsional stiffness, zero backlash and constant velocity.
- Extend system life
 The Reli-a-Flex[™] coupling introduces
 negligible radial and axial bearing
 loads, extending system life.

Patented

Reli-a-Fle	ex™ flexib	le shaft couplings, the range
	Short or Long	 RCS type (short) where space is limited. RCL type (long) where greater parallel offset and greater accuracy are required.
	Reli-a- Grip™	 The Reli-a-Grip[™] clamp enables Reli-a-Flex[™] coupling to be used to its full potential. Greater torques can be transmitted without the need to use set screws, which can potentially damage the shaft.
	Precision or Micro	 Precision coupling with outer diameters from 13 to 25mm. Micro coupling with outer diameters from to 10mm.
	Clamp or Set screw	 Clamp type leaves shaft unmarked. Set screw type where higher speeds required.
S.	Electrically insulated	 Protects delicate instruments from powered drive. Available with selected bores on RCL type aluminium couplings, sizes 20 and 25.
	Custom designs	 Predictable performances. Available with outer diameters from 6 to 40mm. Alternative materials may be specified.

Technical features - Apply to the whole Reli-a-Flex[™] range

- Zero backlash, reliable one-piece construction.
- Unique design maximises torsional stiffness without inducing high bearing loads.
- Minimal velocity and positional fluctuations.
- Over 50,000,000 test cycles at rated load and 80% offset without failure.
- Maintenance free.

Picture perfect scanning with Reli-a-Flex™

With the latest advances in digital optical scanning speed, professional flatbed scanner manufacturers are requiring more accuracy from their drive systems. A European company with leading edge technology in drum and flatbed scanners, image setting and integrated media processor products uses Reli-a-Flex[™] couplings in all their flatbed products. With XY technology, speeds of up to 50 scans per hour and resolutions of up to 5400 dpi, the accuracy and reliability of the Reli-a-Flex[™] coupling makes it the ideal choice.

Prior to the introduction of the Reli-a-Flex[™] coupling slight variations in the speed of the CCD element caused errors when trying to capture high resolution images. These errors manifest themselves as a colour registration defect, which resulted in an unacceptable banding effect across the image. Although these errors were small (typically 3.0 microns) they could easily be detected by the naked eye.

The cause of these errors was identified as the flatbed drive system. Introduction of a Reli-a-Flex[™] coupling manufactured from low inertia Grade 7075-T6 Aluminium was instrumental in bringing these registration defects under control. The unique slit pattern with radial rather than spiral slits gives the Reli-a-Flex[™] coupling high torsional stiffness and unsurpassed accuracy. However, with Reli-a-Flex[™] high torsional stiffness does not mean high bearing loads, the Reli-a-Flex[™] slit pattern has been carefully designed to give low bearing loads in conjunction with its high torsional stiffness.

Also, being tested to 50 million cycles at rated torque, the Reli-a-Flex[™] coupling is ideal for high duty cycle applications such as busy printing and typesetting applications. All in all the Reli-a-Flex[™] coupling has proved itself to be ideal for accurate positioning and responsive servo systems.

Reli-a-Flex[™]

In the final analysis, Reli-a-Flex[™] shines through

During development of a new generation of micro plate analysis machines, engineers at a leading European scientific instrument supplier used the Reli-a-Flex[™] coupling as a critical part of the drive and positioning system.

In line with the industry trend to achieve more accurate, faster machines this particular machine has taken a leap ahead of the competition, being specially developed for life scientists working with very high throughput.

Accuracy and speed of operation of the transport mechanism are critical. Handling plate formats from 96 up to 1536 wells, and the capability to read 1536 wells in less than one minute meant that the correct selection of coupling was essential. Analytical techniques include fluorescence intensity, absorption fluorescence, polarised time delayed fluorescence, and glow luminescence.

The Reli-a-Flex[™] coupling was chosen as the link between the drive motor and the transport mechanism. High torsional stiffness, low inertia and accurate transmission of motion between the motor and the leadscrew drive were provided by a size 16 Reli-a-Flex[™] coupling.

The patented slit pattern of the Reli-a-Flex[™] coupling gives it very high torsional stiffness (comparable to bellows type couplings) whilst still providing very low bearing loads and extremely accurate transmission of motion. In applications requiring more stringent accuracy requirements the Reli-a-Flex[™] coupling helps the designer by introducing minimal errors of rotation. With a positional error budget of +/- 0.1mm the Reli-a-Flex[™] coupling was the only choice. Similar one piece spiral slitted couplings can introduce errors of up to +/-0.006mm, however with predicted Reli-a-Flex[™] errors of only +/-0.001, there was no comparison.

In fact, not only is the Reli-a-Flex[™] design the stiffest and most accurate one-piece flexible coupling available today, but the patented special slit pattern significantly reduces stress in the flexing elements as the coupling rotates. This ensures that the Reli-a-Flex[™] coupling is extremely reliable and exceeds the performance of other onepiece slitted couplings. Made from low inertia 7075-T6 Aluminium the Reli-a-Flex[™] coupling has been fully tested. Life expectancies of greater than 50 million cycles can be readily achieved, making it ideal for today's new generation of accurate, reliable and fast machines.

 sales@reliance.co.uk

INSTALLATION

Couplings are available with either clamp or set screw mounting. Clamp fastening, both Reli-a-Grip[™] and traditional, allows repeated repositioning of the coupling on the shaft leaving the shaft unmarked. The effectiveness of the clamp is dependent on the diameter being a 'close' fit in the coupling bore. Use of Reliance components will ensure that the clamp works correctly.

Set screws provide an effective but non-adjustable means of connecting couplings and shafts. Ideally the shafts should have a small flat in the area of the screw which allows the set screw to seat below the surface of the shaft.

TORSIONAL STIFFNESS

This is the characteristic that describes the angular deflection when a torque is applied. High torsional stiffness contributes to increased accuracy and system response. It is essential for accurate feedback applications. Applications that are subject to shock loads may require a less stiff coupling to reduce the peak torques and avoid premature failure or slipping clamps.

RADIAL COMPLIANCE

This is the characteristic that describes the force the coupling applies on the support bearings when the shafts are misaligned. High radial compliance is essential to provide low bearing loads.

TORQUE CAPACITY

In general, the rated torque figures are based on >10⁶ torque reversals and the peak torque should not be applied for more than 1% of the duty cycle.

+44 (0)1484 601061 sales@reliance.co.uk

SHAFT MISALIGNMENT

The most common type of misalignment is a combination of angular, parallel and axial misalignment and occurs due to the build-up of tolerances as associated parts are assembled together. As these accumulate randomly, worst-case misalignment should be calculated and used to select the correct coupling to avoid premature failure.

Angular	Parallel	Axial	Combined
			THE T

TRANSMISSION ERROR

Often referred to as kinematic error, this is the total error in the driven shaft position with respect to the driving shaft position. In a system the following factors must be individually considered to determine their overall effect.

a.	Backlash	internal clearance relate	d
b.	Torsional wind up	torsional stiffness related	b

c. Velocity error..... coupling design related

a. Backlash

Is the amount of free rotational movement inherent in the coupling under zero or near zero torsional loads. Only the Oldham coupling type in this brochure is susceptible to slight backlash.

b. Torsional wind up

In applications where the resistance is frictional, the driven shaft will experience a position lag, which will double with direction reversal, proportional to the torsional stiffness.

During operating mode, the inertia and the torque will cause a momentary lag but this will not be seen at standstill.

c. Velocity error

In general, couplings with double flexing elements (Reli-a-Flex[™], Bellows and Twin disc couplings) will introduce negligible velocity errors.

Velocity errors occur with angular misalignment and are proportional to shaft angle. Only the Oldham coupling type in this brochure is susceptible to this error.

LUBRICATION

This is not required on any of the couplings in this brochure.

TORSIONAL RESONANCE

The torsional natural frequencies of a system are dependent on the mass/elastic characteristics of the various inertias and connecting shafts. Torsional resonance can occur under certain conditions when the natural frequency of the system is close to the excitation frequency of the driving system. It is most likely to occur when the load is predominantly inertial and can occur in closed loop position or velocity control systems, leading to torsional vibrations which in severe circumstances can destroy the coupling.

Choosing a coupling that operates well above or well below the operating frequencies can help to avoid premature failure.

The resonant frequency of a system can be calculated from the following:

$$F_{R} = 1/2\pi \times \sqrt{(1/J_{M} + 1/J_{L}) \times 10.8/\pi \times C_{T}}$$

where

- F_{R} = Resonant frequency (Hz)
- J_{M} = Motor inertia (Kgm²)
- J_{L}^{m} = Load inertia (Kgm²) C_T = Coupling torsional stiffness (mNm/min)

FLOATING SHAFTS

We do not recommend the use of couplings in this brochure for floating shafts, where one or both ends of a shaft are supported by a coupling.

About Us

Reliance Gear Company was founded in Huddersfield in 1920 and has been under current ownership since 1955. A sister company, Reliance Precision, has been operating in the Republic of Ireland since 1971.

ISO 9001

Quality assured to BS/EN/ISO 9001, Reliance specialises in gears, gearboxes, assemblies and associated components which are used in instrumentation, measurement, diagnostic equipment and light actuation systems. Reliance aims to provide its customers with a single source for the design, production, assembly and testing of high quality mechanical components and electro-mechanical assemblies.

Standard Products

For over thirty years, Reliance has provided a standard range of precision mechanical components from stock or on short delivery. This service allows design engineers to order in small quantities at stock prices in order to develop prototypes effectively. Dedicated manufacturing facilities enable larger quantities to be supplied for full production requirements.

Dust Free Assembly

Reliance also has over 350 square metres of clean room space for the assembly, wiring and testing of precision gearboxes, optical equipment and scientific instruments to customers' specifications. Particle counts in the clean rooms meet ISO 14644-1 Class ISO 7, but are readily adaptable to more stringent standards if required.
