

**SKF**

# SNL plummer block housings solve the housing problems

Revised edition

# Contents

**Made by SKF®** stands for excellence. It symbolises our consistent endeavour to achieve total quality in everything we do. For those who use our products, “Made by SKF” implies three main benefits.

**Reliability** – thanks to modern, efficient products, based on our worldwide application know-how, optimised materials, forward-looking designs and the most advanced production techniques.

**Cost effectiveness** – resulting from the favourable ratio between our product quality plus service facilities, and the purchase price of the product.

**Market lead** – which you can achieve by taking advantage of our products and services. Increased operating time and reduced down-time, as well as improved output and product quality are the key to a successful partnership.

# Fewer bearing replacements and less maintenance

## Plummer block housings have much to offer

The main benefit of split plummer block housings is their easy installation; pre-assembled shafts can be mounted in them. When the housing bases are attached to the base plate it is then only necessary to place the housing caps in position and to tighten the attachment bolts to complete the installation.

Split plummer block housings available on the market are mainly intended for self-aligning ball bearings, spherical roller bearings and CARB® bearings of ISO Dimension Series 02, 03, 22, 23 and 32. They can often be fitted with various different seals. Many designs and variants of split plummer block housings are available making the use of tailored housings unnecessary and thus enabling cost effective bearing arrangements to be made.

For many years SKF has been one of the leading producers of split plummer block housings – synonymous with operational reliability, quality and versatility.

## SNL plummer block housings have more to offer

SKF has developed the SNL plummer block housings to be the first choice for design, quality and economy. This enables customers to keep a step ahead.

SNL plummer block housings enable the full service life potential of the incorporated bearings to be exploited

with less need of maintenance. This supports user efforts to further reduce maintenance costs. Among other characteristics the housings are very stiff, making them insensitive to uncontrolled and excessive tightening of the attachment bolts.

Another benefit is the choice of oil or grease lubrication for the bearings housed in SNL plummer blocks. A range of efficient seals for oil lubrication and rough environments make for trouble-free operation.

## One basic design – many variants

SNL plummer block housings are primarily intended for self-aligning ball bearings, spherical roller bearings and CARB bearings. The housings are designed on a “building block” principle. This enables a more generous choice of bearing, shaft mounting, seals and type of lubrication. Stocking is also simplified.

### A building block system

The basis of the SNL plummer block housing system consists of a number of housings of the same design but in different sizes. By combining these housings with the different standard seals a wide variety of housing variants, all belonging to the standard range, can be supplied to cover the majority of demands for plummer blocks for shafts having diameters of 20 to 160 mm, inclusive. The standard range also covers other variants, for example, housings with drilled and tapped holes for lubrication nipples or condition monitoring sensors. Housings are also available for bearings for larger shaft diameters (→ **page 79**).

SNL plummer block housings are made of grey cast iron and demonstrate high strength. Should, however, this strength be inadequate, dimensionally equivalent plummer block housings of spheroidal graphite cast iron can be supplied.

### Several sealing options

An important advantage of the SNL plummer block housings is that they can be fitted with a variety of seals. The standard seals supplied by SKF comprise double-lip seals, V-ring seals, felt seals, labyrinth seals and heavy-duty “taconite” seals as well as end covers. Other standard seals are also available for SNL housings, but these are supplied together with the housings as the housing has to be modified to take them. These are oil seals and heavy-duty axial taconite seals.

SNL plummer block housings are fully interchangeable with the earlier SNH housings. Their dimensions conform to ISO 113:1994.

### Painting system

SNL plummer block housings are painted as standard in accordance with ISO 12944-2, environmental Class C2. Black colour: RAL 9005.

## Costs and risks – at a low level

SNL plummer block housings have several advantages, such as the high load carrying capacity and machining quality as well as the wide variety of sealing alternatives with the following design and performance characteristics.

**Stiff design**

The housing base is reinforced with ribs and extra material surrounding the holes for the attachment bolts in order to provide improved seating on the base plate. The attachment bolts can be preloaded to give correct location and prevent deformation of the housing base and bore.

**Excellent heat conduction**

The web (rib) reinforcement of the housing base enlarges the contact area between base and base plate and allows for an improved heat flow from the bearing outer ring to the base plate. The bearings will run 5 to 10 % cooler than in other housings.

**Drilled and tapped hole with nipple**

SNL housings have a drilled and tapped hole as standard in the cap. The hole is protected by a plastic plug. The nipple is supplied, together with a nipple protector, with the housing (packed inside). If the application is such that relubrication is required it is only necessary to screw the nipple into the hole and lubricant can be supplied to one side of the bearing.

**Caps and bases individually marked**

The housing base and cap are matched during manufacture and are not interchangeable with the caps and bases of other housings. To prevent mixing caps and bases when mounting several housings, the same consecutive number is marked on the cap and base of each individual housing.

• Stiff design	Insensitive to uncontrolled tightening of the attachment bolts, low operating temperatures
• Excellent heat conduction	Low bearing temperatures, high speed operation possible with oil lubrication, long relubrication intervals, long service life, low lubricant consumption
• Drilled and tapped hole with nipple	Relubrication facility as standard
• Caps and bases individually marked	Avoids mixing of caps and bases, permits traceability
• Indications for holes to take other components	Simple and easy adaptation of standard housing to individual applications, easy attachment of condition monitoring equipment
• Simple mounting	Simple and reliable mounting and maintenance
• Additional seals	Several sealing options, long bearing service lives

**Indications for holes to take other components**

SNL housings can be fitted with sensors serving permanently installed condition monitoring equipment based on vibration measurements. The positions where holes can be drilled to take these sensors are indicated on the housing.

**Simple mounting**

In order to simplify mounting and make alignment more accurate, cast indications, which are vertical to the centre of the bore of the housing, are provided on the end faces as well as on the side faces of the housing base. Mounting instructions, included with each seal pack, give valuable tips.

**Additional seals**

Two new seal designs have been developed specifically for SNL housings. One is intended for difficult conditions which call for a robust seal which can be relubricated and the other is for high speeds and oil lubrication.

## High performance for all sectors

High load carrying capacity and reliability, easy maintenance, the variety of applications and robust designs have made SKF housings a must. The most important sectors of industry and their demands are listed below.

One important reason for the popularity of SKF housings is the increased awareness of the impact of enhanced quality on the cost of a machine and its total life.

### Industry

- Pulp and paper
- Metallurgical
- Mining and construction
- Fluid machinery
- Materials handling
- Handling systems

### Demands

- Long service life
- Robust design
- Long relubrication intervals
- Ready for relubrication
- Condition monitoring facilities
- Avoid risk of mixed caps
- Fast and easy mounting and dismounting

### Solution

1

# Bearing arrangement design

SNL plummer blocks can be used with self-aligning ball bearings, spherical roller bearings or CARB bearings fitted on smooth (plain) or stepped shafts; the bearings can be mounted on adapter or withdrawal sleeves or directly on cylindrical shaft seatings. The plummer blocks can also be used with other bearing types of suitable Dimension Series.

## 1. Bearings on adapter sleeves on smooth shafts

### Advantages

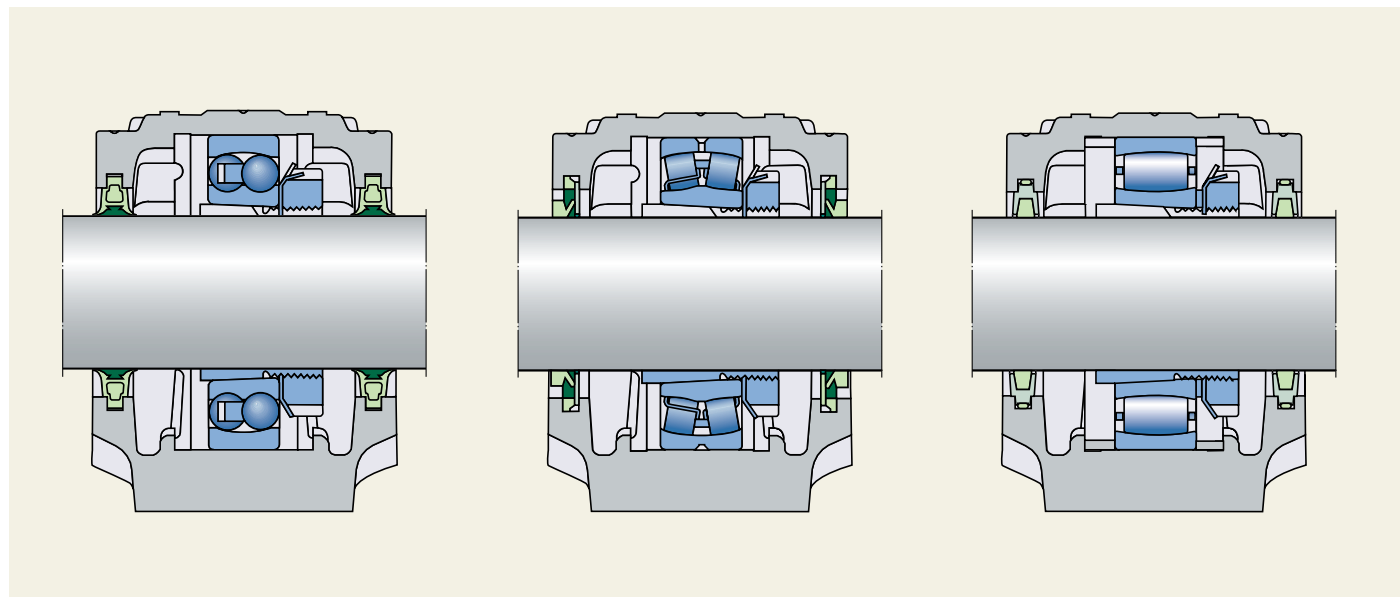

- Drawn round bar (tolerance h9) can be used without machining
- Maximum shaft strength as there is no weakening by shoulders or reliefs
- Bearings can be mounted at any position on the shaft
- Mounting force, i.e. the force required to drive up the bearing on to the sleeve, is some 40 % smaller than with other bearing arrangements on sleeves because friction occurs only in one contact

- Bearing radial clearance can be adjusted within certain limits during mounting to meet application demands

### Applications

- Bearing arrangements for relatively long shafts where more than two bearings are required for support
- Bearings arrangements where machine components are mounted using wedging or tensioning components which do not require the shaft to be machined
- Bearing arrangements where the final position of the bearing cannot be accurately determined

### *Bearings on adapter sleeves on smooth shafts*

## 2. Bearings on adapter sleeves on stepped shafts

### Advantages

- The bearing position on the shaft is accurately determined by the abutment ring
- Other components on the shaft can be axially located by the bearing on its sleeve via spacer sleeves
- Easy dismounting as the bearing inner ring is in contact with the abutment ring
- Bearing radial clearance can be adjusted within certain limits during mounting to meet application demands

### Applications

- Bearing arrangements at shaft ends
- Bearing arrangements where frequent mounting and dismounting are required

*Bearings on adapter sleeves on stepped shafts*

SNL 5						SNL 6				
12 EK	22 EK	222 EK	232 CCK	C 22 K	C 32 K	13 EK	23 EK	213 CCK	223 EK	C 23 K

### 3. Bearings on withdrawal sleeves on stepped shafts

**Advantages**

- The bearing position on the shaft is accurately determined by the shaft shoulder
- Other components on the shaft can be axially located by the bearing on its sleeve via spacer sleeves
- Easy dismounting using a withdrawal or hydraulic nut
- Bearing radial clearance can be adjusted within certain limits during mounting to meet application demands

**Applications**

- Bearing arrangements at shaft ends
- Bearing arrangements where frequent mounting and dismounting are required

*Bearings on withdrawal sleeves on stepped shafts*

# 4. Bearings on cylindrical seatings on stepped shafts

## Advantages

- The axial load carrying capacity of the bearings (in both directions) is not limited by a sleeve
- The residual bearing internal clearance is determined by the tolerance of the shaft seating so there is no danger of radially preloading the bearing during mounting
- The bearing position on the shaft is accurately determined by the shaft shoulder
- The bearing can be supported by other components via spacer sleeves
- The shaft diameter at the bearing position is maximised

## Applications

- Bearing arrangements where large numbers of bearings have to be mounted
- Bearing arrangements where large shock loads can occur

*Bearings on cylindrical seatings on stepped shafts*

# Standard seals

An important advantage of SNL plunger block housings is that they can be fitted with different types of seal. The standard seals available from SKF are split double-lip seals and felt seals, one-piece V-rings, labyrinth seals and the heavy-duty “taconite” seals. The

seals are easy to install and are supplied separately.

All the standard seals as well as the seals for use with oil lubrication are presented in **Table 1**, which gives a comprehensive overview of the seal types, their design features and their suitability for various operating conditions. Detailed information on the

various standard and special seals including properties and availability will be found on **pages 16 to 21**.

160	480	840	960
165	460	810	930
170	450	790	900

The speeds are valid when the seals are operated at temperatures between -40 and +100 °C (permissible temperature range). At temperatures outside this range and/or at speeds higher than those given, labyrinth seals should be used.

<sup>1)</sup> The guideline values are based on the permissible sliding speed at the seal/counterface contact. However, the permissible shaft speed is determined by the speed rating for the bearing to be used in the housing  
<sup>2)</sup> The guideline values are based on a peripheral speed of 4 m/s. Higher speeds are possible, see under "Felt ring seals"

**Double-lip seals**

Double-lip seals (→ fig 1) are made of polyurethane, a wear-resistant material which has good elastic properties. The seals are split so that they are easy to fit. They are intended for grease lubrication and can be used at peripheral speeds of up to 8 m/s. The permissible angular misalignment is approximately 1° for shaft diameters up to approximately 100 mm and 0,5° for larger sizes. The seal counterface on the shaft should be ground and the surface roughness  $R_a$  should not exceed 3,2  $\mu\text{m}$ . The recommended shaft tolerance is h9. When using housings with grease escape hole (suffix V) the speed limit is 4 m/s due to increased pressure on the inner seal lip.

The axial movement of the shaft relative to the housing is not limited when double-lip seals are used.

The double-lip seals are always supplied in packs of two seals. When housings are used at shaft ends, i.e. with one end cover, one of the seals will be left over and can be kept as a spare. The double lip seals are identified by the designation prefix TSN

followed by the size identification and the suffix G, e.g. TSN 511 G.

**V-ring seals**

The V-ring seals (→ fig 2) consist of a V-ring and a sheet steel sealing washer with vulcanised rubber lip which fits into the sealing groove in the housing. The washer is protected against corrosion. The V-rings are made of nitrile rubber (NBR) and have a slim sealing lip which seals axially against the sealing washer. The V-ring “body”, which sits tightly on the shaft and rotates with it, also serves as a flinger. V-ring seals provide efficient sealing even under difficult operating conditions such as high speeds, rough finished shafts etc. They can be operated at peripheral speeds in excess of 7 m/s if the V-ring is prevented from moving or lifting from the shaft by a support ring. Recommended dimensions for appropriate support rings (for axial and radial location) are given in Table 3.

The permissible angular misalignment for V-ring seals is approximately 1,5° for a 50 mm shaft decreasing to

approximately 1° for a shaft diameter of 150 mm and above. The axial movement of the shaft relative to the housing is limited to  $\pm 1$  mm for shaft diameters up to 65 mm and to approximately  $\pm 1,2$  mm for larger shaft diameters.

The V-ring seals are always supplied in packs of two seals. When housings are used at shaft ends, i.e. with one end cover, one of the seals will be left over and can be kept as a spare. The V-ring seals are identified by the designation prefix TSN followed by the size identification and the suffix A, e.g. TSN 511 A.

**Felt ring seals**

Felt ring seals (→ fig 3) are simple but efficient seals for use with grease lubrication. They can be operated at peripheral speeds up to 4 m/s. The seals can be used at much higher speeds but at high speeds a small gap will be formed between the felt and the shaft and the seal becomes a non-rubbing gap-type seal. For plummer block housings with bearings on adapter sleeves on smooth shafts the felt ring seals are split. The impregnated felt is inserted in light alloy half-rings. It is only necessary to insert the seals in the grooves in the housing. The rubber O-section cords should be put into the grooves first as they prevent the seal rings from turning.

SNL plummer block housings for bearings mounted on cylindrical seatings on stepped shafts, sizes 205 to 218 inclusive, can also be supplied with felt seals. In this case the seals consist of loose felt strips which can be inserted in the sealing grooves. Before mounting, the FS felt strips should be left to soak for a few minutes in hot oil.

For applications with spherical roller bearings or CARB bearings which are to operate at continuously high temperatures up to approximately +250 °C, SKF graphited FSB sealing strips made of aluminium boron silicate can be used. They are suitable for peripheral speeds up to 2 m/s. The strips have been well proven as seals on autoclave trucks. Reference should be made to the publication 4402 "SKF deep groove ball bearings for extreme temperatures cut machine life cycle costs" which will be sent on request.

The permissible angular misalignment is approximately 0,5°. The seal counterface on the shaft should be ground and the surface roughness  $R_a$  should not exceed 3,2 µm.

The axial movement of the shaft relative to the housing is not limited when felt seals are used.

The ready-to-mount felt ring seals (in light alloy half-rings) are always supplied in packs of two seals. When housings are used at shaft ends, i.e. with one end cover, one of the seals will be left over and can be kept as a spare. The felt ring seals are identified

by the designation prefix TSN followed by the size identification and the suffix C, e.g. TSN 511 C.

The felt ring seals can also be supplied with an FSB insert. The rubber O-section cords are replaced by fluoro rubber O-section cords. These seals are identified by the suffix CB, e.g. TSN 511 CB.

**Felt ring seal**

Fig 3

Ready-to-mount felt ring seal

Felt strips

**Labyrinth seals**

Under difficult operating conditions and/or at high speeds the use of labyrinth seals (→ fig 4) is recommended. The labyrinth rings are made of steel and have two radially arranged labyrinth steps which form a narrow sealing gap with the housing grooves.

Hollow O-ring cords of silicone rubber (supplied with the seals) ensure that the labyrinth rings, which are mounted with a loose fit, rotate with the shaft. Angular misalignments of the shaft up to approximately 0,3° are permissible. The operating temperature range for the labyrinth seals is -50 to +200 °C.

When labyrinth seals are used, axial movement of the shaft relative to the housing is not limited. The recommended shaft tolerance is h9.

The labyrinth seals are supplied singly. For bearing arrangements for through shafts it is therefore necessary to order two rings. The labyrinth seal is identified by the prefix TSN followed by the size identification and the suffix S, e.g. TSN 511 S.

**Taconite heavy-duty seals**

Taconite is a very fine-grained mineral which is extremely difficult to seal against. For bearing arrangements which must operate under very arduous conditions such as those encountered in mining, labyrinth seals which can be relubricated are recommended, as grease enhances the sealing effect and extends the serviceability of the seals. SKF has developed two different designs of these heavy-duty seals (which can seal against taconite, hence the name) which can be supplied for use with SNL housings.

The one taconite seal design (→ fig 5) is based on a radial labyrinth seal and fits the standard housings. A V-ring seal mounted on the shaft seals against the non-rotating part of the seal, which is inserted in the seal groove and prevents contaminants from penetrating to the bearing when the seal is relubricated. This grease is supplied via a grease nipple in the non-rotating part of the seal. Angular misalignments of the shaft of up to approximately 0,5° are possible. The permissible operating temperature

range for the seal is between -40 and +100 °C.

The axial movement of the shaft relative to the housing is limited for this type of taconite seal to ±1 mm for shaft diameters up to 65 mm and to approximately ±1,2 mm for sizes up to 100 mm and ±1,5 mm for larger shaft diameters. The recommended shaft tolerance is h9.

These seals are supplied singly so that for housings used on through shafts, it is necessary to order two seals. The seal is identified by the prefix TSN followed by the size identification and the suffix ND, e.g. TSN 511 ND.

The other design of taconite seal (→ fig 6) is based on a labyrinth seal with the labyrinth stages arranged axially and does not fit the standard housings. The seal is relubricated via lubrication holes and nipples in the housing cap. The positions for the holes are marked by dimples in the casting. The permissible misalignment of the shaft relative to the housing for this seal is approximately 0,5°. The operating temperature range is from

2

*Labyrinth seal*

Fig 4

*Taconite heavy-duty seal*

Fig 5

*Taconite heavy-duty seal*

Fig 6

–40 to +250 °C. Axial movement of the shaft relative to the housing is also limited. The recommended shaft tolerance is h9.

The modified SNL housings are always supplied together with the seals and are available from size 515-612. The housings with seals are identified by the designation suffix TNC, e.g. SNL 515 TNC or SNL 612 TNC. A housing intended for a shaft end with one seal and one end cover is identified by an additional suffix A, e.g. SNL 515 ATNC. The seal itself is designated TSN .. NC.

A variant of the TNC seal with an additional V-ring can also be supplied. The seal is identified by the letters TNB and can be supplied to order.

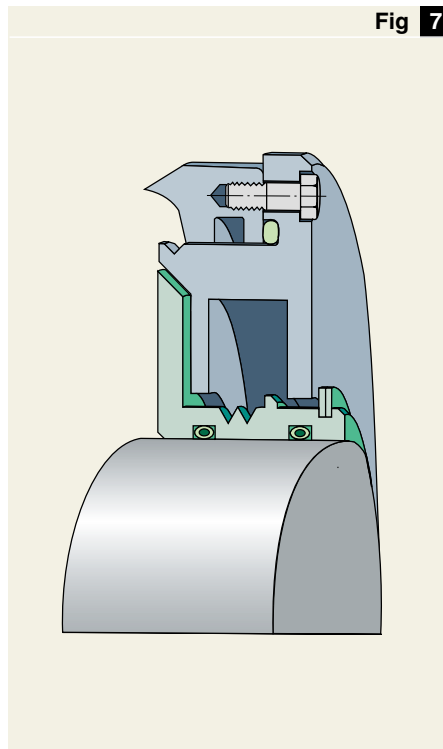

### Seals for oil lubrication

Special seals (oil seals) are required to prevent oil from escaping from the housing when oil lubrication is applied. For SNL housings, SKF has developed the non-rubbing seal of the U design (→ fig 7). These U seals also require modified housings and comprise two parts: one which is stationary and is screwed to the housing and the other which is mounted on the shaft and rotates. A hollow O-ring cord of silicone rubber inserted between the labyrinth ring and the shaft ensures that the ring, which is mounted with a loose fit, rotates with the shaft, and oil cannot escape along the shaft. These oil seals do not limit axial movement of the shaft relative the housing. The recommended shaft tolerance is h9.

The modified SNL housing is supplied together with the seals as a unit. The housings with seals are identified by the suffix TURU, e.g. SNL 524 TURU. Special end covers can be supplied separately on request, designation ASNH .. R.

### Oil seal

Fig 7

## Special seals

Applications where, for some reason or other, the standard seals cannot be used must be fitted with special seals. The SNL housings can be supplied without seals for such applications and are relatively easy to equip with special seals. It is recommended that housings of series SNL 2 are used rather than those of series SNL 5-6 as they have a comparatively larger bore at the shaft entrance. There is therefore more room to accommodate a seal, so that there is more choice as regards seal design.

Special seals are not normally supplied by SKF. Therefore, the relevant housing dimensions are given in

**Table 4.**

*Sealing groove dimensions*

## End covers

For housings mounted at the ends of shafts, the one opening should be fitted with an end cover which fits into the seal groove (→ **fig 8**). Details of the permissible length of the shaft end can be found in **Table 5**. The end covers are of plastic and are suitable for operating temperatures in the range  $-40$  to  $+110$  °C.

At higher temperatures sheet steel end covers should be used instead. These can be cut out from steel sheet and should be inserted with a hollow O-ring cord of silicone rubber in the seal groove in the housing. The relevant seal groove dimensions are given in **Table 4**.

The standard end cover of plastic is designated by the prefix ASNH followed by the housing size identification, e.g. ASNH 511-609.

## Locating rings

The bearing seating in the housing is sufficiently wide to enable the bearing to be displaced axially. Bearings which are to locate a shaft axially in both directions (locating bearings) must always be fixed axially in position in the housing bore by locating rings at both sides (→ **fig 9**).

CARB bearings are non-locating bearings and cannot take axial loads. Since axial displacement is accommodated within a CARB bearing (together with any misalignment) it is necessary to locate the outer ring axially in its seating by inserting a locating ring at each side of the bearing.

The locating rings are identified by the prefix FRB followed by figures giving the width/outside diameter in millimetres, e.g. FRB 11.5/100.

<sup>1)</sup> The dimension  $b_a$  is determined to suit all appropriate bearings with two exceptions:  
 1. with self-aligning ball bearings of series 12 where the total bearing seating width must be available, the values given in brackets apply  
 2. for non-locating arrangements with the widest bearings, as listed above, which are not mounted centrally in the housing, the value of  $b_a$  must be either correspondingly reduced or correspondingly increased

## Axial displacement using CARB bearings in SNL housings

The permissible axial displacement in a CARB bearing is dependent on the clearance remaining in the bearing after mounting: the larger the residual radial internal clearance, the larger the permissible axial displacement of one ring with respect to the other. This axial displacement reduces the clearance in the bearing until at a given displacement, the clearance disappears altogether or the rollers may start to be exposed at one side of the bearing.

**Table 6** shows the maximum permissible axial displacement for each CARB bearing having Normal initial radial internal clearance when mounted normally. It is assumed that there is little difference in temperature between inner and outer ring.

When the rings are displaced a certain distance, the roller and cage assembly will move through half this distance. If the inner ring moves into the bearing, or alternatively, if the outer ring moves out from the bearing the roller and cage assembly can contact the lock nut and locking washer. For bearings of series C 22 K up to and including size 22, therefore, a special

adapter sleeve with a narrow slot and a self-locking KMFE nut must be used to prevent this happening (→ **fig 10**). Such sleeves are supplied by SKF and identified by suffix E, e.g. H 311 E.

For bearings of series C 22 K and C 32 K, from size 24 and above, the adapter sleeves are supplied together with a KML nut, indicated by suffix L in the sleeve designation, e.g. H 2324 L.

It should be observed that the possible axial displacement of the shaft relative to the housing may be limited by the type of seal used.

### CARB bearing on adapter sleeve

<sup>1)</sup>  $s$  is the maximum permissible displacement of one ring with respect to the other in one direction; the total axial displacement is twice as large

# Application advice for trouble-free operation

Condition monitoring is recommended for SNL plummer blocks particularly if they are used on machines where failures would cause production stoppages. The early recognition and trending of the degradation of the machine and machine parts make it possible to analyse the cause and to be able to plan for corrective maintenance actions in good time.

Extensive monitoring experience and a knowledge of the dynamic behaviour of machines, machine components and bearings where there is incipient damage allows SKF to recommend two powerful signal processing techniques which can be used for condition monitoring.

## Vibration velocity

The RMS (root mean square) of the velocity of vibrations in the frequency range 10 Hz to 1 kHz has been used with great success to measure phenomena such as imbalance, misalignment, resonance etc. High levels of velocity vibration can be generated by poor machine conditions such as improper clearances, imbalance, misalignment, weak foundations, bent rotors, out-of-round, belt problems or damaged fan blades. The ISO Standard 10816-1:1995 contains recommendations for reference values for the RMS velocity values measured on different classes of machines and machine parts. These recommendations give a clear and quantifiable measure for the changes in machine condition. Vibration velocity expressed as an overall RMS value in the 10 Hz to 1 kHz frequency range provides minimal information on defects in rolling element bearings or gear mesh problems. These types of defect can now be easily detected by enveloped acceleration in the higher frequency ranges.

## Enveloped acceleration

Bearing defects can be easily recognised by measurement and analysis of an enveloped acceleration signal of

the higher frequencies generated by the impact signals typical of rolling bearing defects and gear teeth problems. This technique has proven to be

*Electronic cabinet with built-in MCM™ units*

*Multilog on-line system*

*Microlog – portable data collector and analyser*

extremely reliable in the detection of incipient bearing defects. The low frequencies generated by imbalance, misalignment etc. are not measured and diagnosed within the enveloped acceleration process.

- Condition monitoring and diagnosis with permanently installed monitoring systems

This type of monitoring makes it possible to check the condition using MCM™ (Mechanical Condition Monitor) for a single measuring point or the multilog LMU (Local Monitoring Unit) which sequentially monitors several measuring points. The MCM™ system should be applied where an economical solution is required (e.g. for fans). The measurement output can be directly connected to a control or DCS (Digital Control System). A relay output is also available to shut down the machine or section of the plant.

- Condition monitoring and diagnosis with a portable data collector and analyser

In this case the condition is monitored using a portable data collector/analyser at appropriate points on the machine. Where a measurement point is difficult to access, permanently installed sensors can be used. These can be connected by cable to a connection box accessible to the data collector.

**Condition monitoring of SNL housings**

SNL housings have appropriate points for sensors (→ fig 1). Measurement points 1 and 2 are perpendicular to the shaft and correspond best to ISO 10816-1:1995. Measurement point 3 lies at approximately 45° to the shaft axis. For enveloped acceleration the angle of inclination of the measuring point is of minor importance.

Measurement points 2 and 3 should be used on SNL housings where the load acts towards the base plate. Measurement point 1 is intended for when the housing is hung from its support or when the load acts away from the base plate.

For additional information about condition monitoring and the measurement tools and systems available from SKF please contact the SKF application engineering service.

**Measurement points for condition monitoring**

# Lubrication

SNL plummer block housings are so designed that the bearings in them can be lubricated with grease or oil, although grease lubrication is generally preferable. The lubricant should be selected with reference to the operating conditions. Relevant information will be found in the SKF General Catalogue and other SKF publications.

## Grease lubrication

In the majority of applications, the amount of grease applied to the SNL housings when mounting (first fill) or after an inspection is adequate until the next planned inspection.

Certain operating conditions, e.g. high speeds, high temperatures or heavy loads, may mean that more frequent relubrication is necessary. **Table 1** gives guideline values for the grease quantities to be applied for the first fill and for relubrication. Seven markings will be found on the housing cap of which six show where holes can be drilled and tapped to take grease nipples.

There is also a drilled and tapped hole for the grease nipple AH 1/8-27 PTF which is supplied with the housing. This hole is closed by a plastic plug. The two markings at the outer sides of

the central ridge indicate the position for lubrication holes for the seals.

It is recommended that spherical roller bearings having a lubrication groove and three holes in the outer ring (designation suffix E or W33) be lubricated via this feature (→ **fig 2**). A hole should be drilled at one of the middle markings on the three bars for this purpose. SNL housings having a drilled and tapped hole in the middle of the cap together with a lubrication nipple can be supplied on request. They are identified by the designation suffix NM, e.g. SNL 511-609 NM.

It should be noted that when spherical roller bearings are to be relubricated via the outer ring, they should be rotated. If outer ring relubrication is not possible or if self-aligning ball bearings or CARB bearings are used the standard grease nipple supplied with the housing should be inserted in the hole provided and used for this purpose (→ **fig 3**). If it is desired to use a grease nipple other than that supplied with the housing, adapters are available which make a reworking of the available drilled and tapped hole unnecessary.

Where V-ring seals are used, the efficacy of relubrication can be much improved if an additional V-ring is mounted inside the housing at the side

**Lubricating the bearing via the outer ring**

**Bearing lubrication via the standard nipple**

The dimensions are those recommended when the standard grease nipple AH 1/8-27 PTF is used (supplied with the housing) but can also be applied if nipples having threads R 1/8, KR 1/8 or M 10x1 are used. An adapter is available which fits the SNL standard lubrication hole, designation LAPN 1/8. Using this adapter nipple with thread G 1/4 and grease dispensers, e.g. SKF SYSTEM 24, can be applied.

Recommended dimensions for grease escape hole

Housing with additional V-ring and splash plate

Housing with grease escape hole

where the grease is applied, so that grease can only exit at the opposite side of the housing. For this purpose a set comprising a V-ring and a splash plate, which covers a sector of more than 180° (→ fig 4), can be supplied. This V-ring and splash plate set is designated by the prefix ASNA followed by the housing size identification and the suffix V, e.g. ASNA 511 V.

Where the bearings are mounted on adapter sleeves, the grease should be introduced at the side opposite to the lock nut of the sleeve. Where housings are mounted at shaft ends, grease should be applied at the end cover side.

Where G or C-design seals are used it should be noted that grease cannot escape via the seals. If frequent relubrication is required when such seals are used, it is advisable to provide the housing with a grease escape hole (→ fig 5) through which excess grease can escape. Recommended dimensions will be found in Table 2. SNL housings with a grease escape hole in the base can be supplied. This housing design is identified by the suffix V, e.g. SNL 511-609 V.

If housings fitted with the G-design double-lip seals are periodically relubricated the seals can only be operated at peripheral speeds up to 4 m/s as otherwise the sealing lips may over-heat and wear.

2

**Oil lubrication**

The SNL housings can be used for oil lubrication at relatively high speeds. When using oil, however, the specially developed U-design seals have to be incorporated to avoid oil loss from the housing (→ fig 6). These seals are described on page 20. In order for these seals to be used the housing must be modified so that SNL housings for oil lubrication are only supplied complete with seals. It is important not to exceed the recommended oil level if leakage is to be avoided (→ Table 3).

Fig 6

*Housing for oil lubrication*

The oil level is measured from the base of the housing. Mark the min and max level on the sight glass.

# Mounting

SNL housings together with SKF bearings are robust and operationally reliable bearing arrangements which have long lives. However, if they are to achieve their full potential and not fail prematurely they must be properly mounted. Incorrect procedures or unsuitable tools can influence life negatively.

## Mounting the bearing

The bearings can be mounted either on a tapered seating – normally for SNL housings in the form of an adapter sleeve – or on a cylindrical seating. When a bearing is correctly mounted on a sleeve there will be interference

fits between the inner ring, sleeve and shaft. The degree of interference is determined by how far the bearing is driven up on the sleeve and either the internal clearance reduction or the axial drive-up distance can be used as a measure. The clearance reduction in spherical roller bearings can be measured using a feeler gauge, or the new SKF drive-up method can be used. Information will be sent on request.

When mounting self-aligning ball bearings having Normal radial internal clearance (which is relatively small) the clearance reduction can be checked by turning and swivelling out the outer ring. When the swivelling out meets a slight resistance, the bearing has a sufficient degree of interference and

the drive-up should be stopped. A particularly simple method of mounting self-aligning ball bearings on adapter sleeves is the use of the spanner set TMHN 7 which has been specially developed for this purpose. Each spanner is marked with the angle though which the lock nut should be turned when self-aligning ball bearings having C3 radial internal clearance are used.

CARB bearings can also be mounted on cylindrical as well as tapered seatings. For tapered seatings, again normally adapter sleeves are employed; the spanner set TMHN 7 can be used for smaller CARB bearings as well as for self-aligning ball bearings. For larger CARB bearings either the clearance reduction or the axial drive-up length should be measured. When using a feeler gauge to measure clearance reduction it is important that the inner and outer rings of the bearing are not displaced with respect to each other. The new SKF drive-up method can also be applied.

Bearings with cylindrical bore are normally mounted with an interference fit on the shaft. Appropriate shaft tolerances should be selected. The recommendations applying to self-aligning ball and spherical roller bearings also apply to CARB bearings.

Details of the spanner set TMHN 7, several other mounting tools as well as the new SKF drive-up method can be found in the SKF catalogue MP200 "Tools for trouble-free operation" which will be sent on request.

## Support surface for housing base

To guarantee long bearing service life it is recommended that the support surface for the housing is finished to  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7. For moderate demands IT8 may be satisfactory.

## Dowel pins

SNL housings are designed for loads acting vertically to the housing base support. If they are to be subjected to moderate or heavy loads acting paral-

**Table 4**

*Position and size of dowel pin holes*

lled to the base support, a stop should be provided, or the housing should be pinned to its support. Recommendations for the position and size of holes to take dowel pins are given in **Table 4** on **page 31**.

### Housings for four-bolt mounting

For the attachment of SNL housings to T-shaped beams, it is possible to drill four bolt holes in the base. The appropriate positions are indicated by dimples. Recommended dimensions are given in **Table 5**. The housings are designated MS2 e.g. SNL 510-608 MS2.

Some housings which are already prepared for four-bolt mounting having 4 cast holes in the base can be supplied. These housings are also prepared for relubrication of the bearing via the outer ring (suffix NM) as standard. Available sizes are shown in **Table 6**. The housings are designated FSNL .. NM, e.g. FSNL 511-609 NM.

### Attachment bolts

It is recommended that hexagon headed bolts to strength class 8.8 according to ISO 4014:1999 should be used. If the load does not act vertically to the base, it may be necessary to use stronger, class 10.9 bolts. Details of the appropriate tightening torques for the bolts to class 8.8 are given in **Table 2** on **page 48**.

2

Bolt hole dimensions

## Mounting SNL housings with double-lip seals

Before starting installation work, the following instructions should be carefully read.

1. Ensure that the environment is clean. Check the dimensional and form accuracy of the shaft seating.
2. Check that the surface roughness of the support surface  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7. For moderate demands IT8 may be satisfactory.
3. If the bearing is mounted on an adapter sleeve, determine the position of the housing. The grease nipple arranged at one side of the housing cap (for improved lubrication) should be at the side opposite to the sleeve nut. Where housings are mounted at shaft ends, grease should be applied at the end cover side. It is necessary to consider the complete housing as the base and cap will only fit together as supplied.
4. Position the housing on the support surface. Fit the attachment bolts but do not tighten them.
5. Insert one seal half in each of the grooves in the housing base. Fill the space between the two sealing lips with grease. If the housing is to be used at the end of a shaft, insert an end cover at one side instead of the seal half.
6. Mount the bearing on the shaft – either directly on a stepped shaft or using an adapter sleeve. Completely fill the bearing with grease. The remainder of the recommended grease quantity should be put in the housing base at the sides (→ **Table 1**, **page 28**).
7. Lay the shaft with bearing in the housing base.

8. Put one locating ring (when needed) at each side of the bearing.

NB. Locating rings are only used for locating bearing arrangements, except for CARB bearings which, although always non-locating, must always be mounted with locating rings.

9. Carefully align the housing base. Vertical markings at the middle of the side faces and ends of the housing base can facilitate this. Then lightly tighten the attachment bolts.
10. The remaining seal halves should be inserted in the seal grooves in the housing cap and the space between the sealing lips filled with grease.
11. The housing cap should be placed over the base and the cap bolts (to join cap and base) tightened to the torque specified in **Table 2** on **page 48**. The cap and base of one housing are not interchangeable with those of other housings. The cap and base should be checked to see that they bear the same identification.
12. Fully tighten the attachment bolts in the housing base. Recommended tightening torques are given in **Table 2** on **page 48**.

## Mounting SNL housings with V-ring seals

Before starting installation work, the following instructions should be carefully read.

1. Ensure that the environment is clean. Check the dimensional and form accuracy of the shaft seating.
2. Check that the surface roughness of the support surface  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7. For moderate demands IT8 may be satisfactory.
3. If the bearing is mounted on an adapter sleeve, determine the position of the housing. The grease nipple arranged at one side of the housing cap (for improved lubrication) should be at the side opposite to the sleeve nut. Where housings are mounted at shaft ends, grease should be applied at the end cover side. It is necessary to consider the complete housing as the base and cap will only fit together as supplied.
4. Position the housing on the support surface. Fit the attachment bolts but do not tighten them.
5. Arrange the one V-ring with sealing washer on the shaft. The V-ring should be furthest away from the bearing and seal against the washer, i.e. the lip should point inwards towards the washer.
6. Mount the bearing on the shaft – either directly on a stepped shaft or using an adapter sleeve. Completely fill the bearing with grease. The remainder of the recommended grease quantity should be put in the housing base at the sides (→ **Table 1**, **page 28**).
7. Arrange the second sealing washer and V-ring on the shaft at the other side of the bearing. If the housing is to be used at the end of a shaft, mount an end cover instead.

8. Lay the shaft with bearing and sealing washers in the housing base.

9. Put one locating ring (when needed) at each side of the bearing.

NB. Locating rings are only used for locating bearing arrangements, except for CARB bearings which, although always non-locating, must always be mounted with locating rings.

10. Carefully align the housing base. Vertical markings at the middle of the side faces and ends of the housing base can facilitate this. Then lightly tighten the attachment bolts.

11. The housing cap should be placed over the base and the cap bolts (to join cap and base) tightened to the torque specified in **Table 2** on **page 48**. The cap and base of one housing are not interchangeable with those of other housings. The cap and base should be checked to see that they bear the same identification.

12. Fully tighten the attachment bolts in the housing base. Recommended tightening torques are given in **Table 2** on **page 48**.

13. Coat the V-ring counterfaces on the sealing washers with grease.

14. Finally, push the V-ring seals into their correct position. This can be done using a screwdriver at the same time as the shaft is turned.

## Mounting SNL housings with felt seals

Before starting installation work, the following instructions should be carefully read.

1. Ensure that the environment is clean. Check the dimensional and form accuracy of the shaft seating.
2. Check that the surface roughness of the support surface  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7. For moderate demands IT8 may be satisfactory.
3. If the bearing is mounted on an adapter sleeve, determine the position of the housing. The grease nipple arranged at one side of the housing cap (for improved lubrication) should be at the side opposite to the sleeve nut. Where housings are mounted at shaft ends, grease should be applied at the end cover side. It is necessary to consider the complete housing as the base and cap will only fit together as supplied.
4. Position the housing on the support surface. Fit the attachment bolts but do not tighten them.
5. Insert the rubber O-section cords in the grooves in the housing base. If the housing is to be used at the end of a shaft, insert an end cover at one side instead of one O-section cord.
6. Place one felt ring seal half (in light alloy ring) over the O-section cord in each sealing groove in the housing base. (Details regarding mounting of loose FS felt strips → **page 18**). If the housing is to be used at a shaft end, the second felt ring seal half is omitted and an end cover inserted in the housing base instead.
7. Mount the bearing on the shaft – either directly on a stepped shaft or using an adapter sleeve. Completely fill the bearing with grease. The remainder of the recommended grease quantity should be put in the housing base at the sides (→ **Table 1**, **page 28**).

8. Lay the shaft with bearing in the housing base.
9. Put one locating ring (when needed) at each side of the bearing.

NB. Locating rings are only used for locating bearing arrangements, except for CARB bearings which, although always non-locating, must always be mounted with locating rings.

10. Carefully align the housing base. Vertical markings at the middle of the side faces and ends of the housing base can facilitate this. Then lightly tighten the attachment bolts.
11. Put the O-ring cord into the sealing grooves in the housing cap.
12. The remaining seal halves should be inserted in the seal grooves in the housing cap over the O-ring cords.
13. The housing cap should be placed over the base and the cap bolts (to join cap and base) tightened to the torque specified in **Table 2** on **page 48**. The cap and base of one housing are not interchangeable with those of other housings. The cap and base should be checked to see that they bear the same identification.
14. Fully tighten the attachment bolts in the housing base. Recommended tightening torques are given in **Table 2** on **page 48**.

## Mounting SNL housings with labyrinth seals

Before starting installation work, the following instructions should be carefully read.

1. Ensure that the environment is clean. Check the dimensional and form accuracy of the shaft seating.
2. Check that the surface roughness of the support surface  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7. For moderate demands IT8 may be satisfactory.
3. If the bearing is mounted on an adapter sleeve, determine the position of the housing. The grease nipple arranged at one side of the housing cap (for improved lubrication) should be at the side opposite to the sleeve nut. Where housings are mounted at shaft ends, grease should be applied at the end cover side. It is necessary to consider the complete housing as the base and cap will only fit together as supplied.
4. Position the housing on the support surface. Fit the attachment bolts but do not tighten them.
5. Mount the first labyrinth seal on the shaft in the correct position.
6. Mount the bearing on the shaft – either directly on a stepped shaft or using an adapter sleeve. Completely fill the bearing with grease. The remainder of the recommended grease quantity should be put in the housing base at the sides (→ **Table 1**, **page 28**).
7. Mount the second labyrinth ring on the shaft in the correct position. If the housing is to be used at a shaft end, the second labyrinth ring is omitted and an end cover inserted in the housing base instead.
8. Lay the shaft with bearing and labyrinth ring(s) in the housing base.

9. Put one locating ring (when needed) at each side of the bearing.

NB. Locating rings are only used for locating bearing arrangements, except for CARB bearings which, although always non-locating, must always be mounted with locating rings.

10. Carefully align the housing base. Vertical markings at the middle of the side faces and ends of the housing base can facilitate this. Then lightly tighten the attachment bolts.
11. The housing cap should be placed over the base and the cap bolts (to join cap and base) tightened to the torque specified in **Table 2** on **page 48**. The cap and base of one housing are not interchangeable with those of other housings. The cap and base should be checked to see that they bear the same identification.
12. Fully tighten the attachment bolts in the housing base. Recommended tightening torques are given in **Table 2** on **page 48**.
13. Finally insert the hollow O-ring cord of synthetic rubber in the grooves in the labyrinth rings. This can be done using a screwdriver while turning the shaft.

## Mounting SNL housings with taconite seals

Before starting installation work, the following instructions should be carefully read.

**1.** Ensure that the environment is clean. Check the dimensional and form accuracy of the shaft seating.

**2.** Check that the surface roughness of the support surface  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7. For moderate demands IT8 may be satisfactory.

**3.** If the bearing is mounted on an adapter sleeve, determine the position of the housing. The grease nipple arranged at one side of the housing cap (for improved lubrication) should be at the side opposite to the sleeve nut. Where housings are mounted at shaft ends, grease should be applied at the end cover side. It is necessary to consider the complete housing as the base and cap will only fit together as supplied.

**4.** Position the housing on the support surface. Fit the attachment bolts but do not tighten them.

**5.** Mount the first V-ring together with one labyrinth seal on the shaft in the correct position. The lip of the V-ring should point towards the bearing. Place the split ring over the V-ring and labyrinth ring and screw together. The two parts of this split ring are not interchangeable. They should be checked to see that they carry the same identification.

**6.** Mount the bearing on the shaft – either directly on a stepped shaft or using an adapter sleeve. Completely fill the bearing with grease. The remainder of the recommended grease quantity should be put in the housing base at the sides (→ **Table 1**, **page 28**).

**7.** Mount the second seal according to point 5. If the housing is to be used at a shaft end, the second seal is omitted and an end cover inserted in the housing base instead.

**8.** Use the hollow O-section cord to fix the labyrinth ring in position on the shaft. A screwdriver can be used to fit the cords whilst rotating the shaft. Mount the O-ring on the seal outer diameter.

**9.** Lay the shaft with bearing and seals in the housing base taking care that the O-rings are not damaged.

**10.** Put one locating ring (when needed) at each side of the bearing.

NB. Locating rings are only used for locating bearing arrangements, except for CARB bearings which, although always non-locating, must always be mounted with locating rings.

**11.** Carefully align the housing base. Vertical markings at the middle of the side faces and ends of the housing base can facilitate this. Then lightly tighten the attachment bolts.

**12.** The housing cap should be placed over the base and the cap bolts (to join cap and base) tightened to the torque specified in **Table 2** on **page 48**. The cap and base of one housing are not interchangeable with those of other housings. The cap and base should be checked to see that they bear the same identification.

**13.** Fully tighten the attachment bolts in the housing base. Recommended tightening torques are given in **Table 2** on **page 48**.

**14.** Finally, before the first test run, rotate the shaft and supply grease via the nipple until it exudes from the labyrinth rings. The same grease as that used for the bearing should also be used to lubricate the labyrinth rings.

## Mounting SNL housings with oil seals

Before starting installation work, the following instructions should be carefully read.

1. Ensure that the environment is clean. Check the dimensional and form accuracy of the shaft seating.
2. Check that the surface roughness of the support surface  $R_a \leq 12,5 \mu\text{m}$ . The flatness (planicity) tolerance should be to IT7.
3. If the bearing is mounted on an adapter sleeve, determine the position of the housing.
4. Position the housing on the support surface. Fit the attachment bolts but do not tighten them.
5. Assemble the seals. Check if the O-ring and silicon tubes are at their right positions in respective groove (→ fig 7 on page 20).
6. Cover the shaft with a thin layer of oil. Slide the first seal to its right mounting position, some millimetres outside its working position.
7. Mount the bearing on the shaft – either directly on a stepped shaft or using an adapter sleeve.
8. Slide the second seal to the right position on the shaft, as described in point 6. If the housing is to be used at a shaft end, the second seal is omitted and the inner part of the end cover is inserted in the housing base seal groove.
9. Lay the shaft with bearing and seal assemblies in the housing base.
10. Put one locating ring (when needed) at each side of the bearing.

NB. Locating rings are only used for locating bearing arrangements, except for CARB bearings which, although always non-locating, must always be mounted with locating rings.

11. Carefully align the housing base. Vertical markings at the middle of the side faces and ends of the housing base can facilitate this. Then lightly tighten the attachment bolts.

12. Cover the mating surfaces of the housing with oil-resistant sealant Loctite 573 or equal. The housing cap should be placed over the base and the cap bolts (to join cap and base) tightened to the torque specified in **Table 2** on **page 48**. The cap and base of one housing are not interchangeable with those of other housings. The cap and base should be checked to see that they bear the same identification.

13. Fully tighten the attachment bolts in the housing base. Recommended tightening torques are given in **Table 2** on **page 48**.

14. Slide the seals against the housing side surfaces. Mount the seal-mounting screws and tighten them. If an end cover has been mounted fully tighten the screw on the external part of the end cover.

15. Mount the supplied ventilating plug on the top of the housing and when oil bath shall be used, mount the oil level sight glass. When circulating oil lubrication shall be used connect the oil inlet and outlet pipes to the housing.

16. When oil bath is used, the max and min oil level should be indicated on the sight glass. Recommended oil level to be used for the mounted bearing can be found in **Table 3** on **page 30**.

NB. For oil bath it is important not to overfill the max level as this can cause oil leakage from the housing. For circulating oil is it important that the outlet pipe/pipes can drain the housing in a proper way to avoid overfill of oil inside the housing.

17. Protect the housing assembly from negative pressure from surrounding equipment.

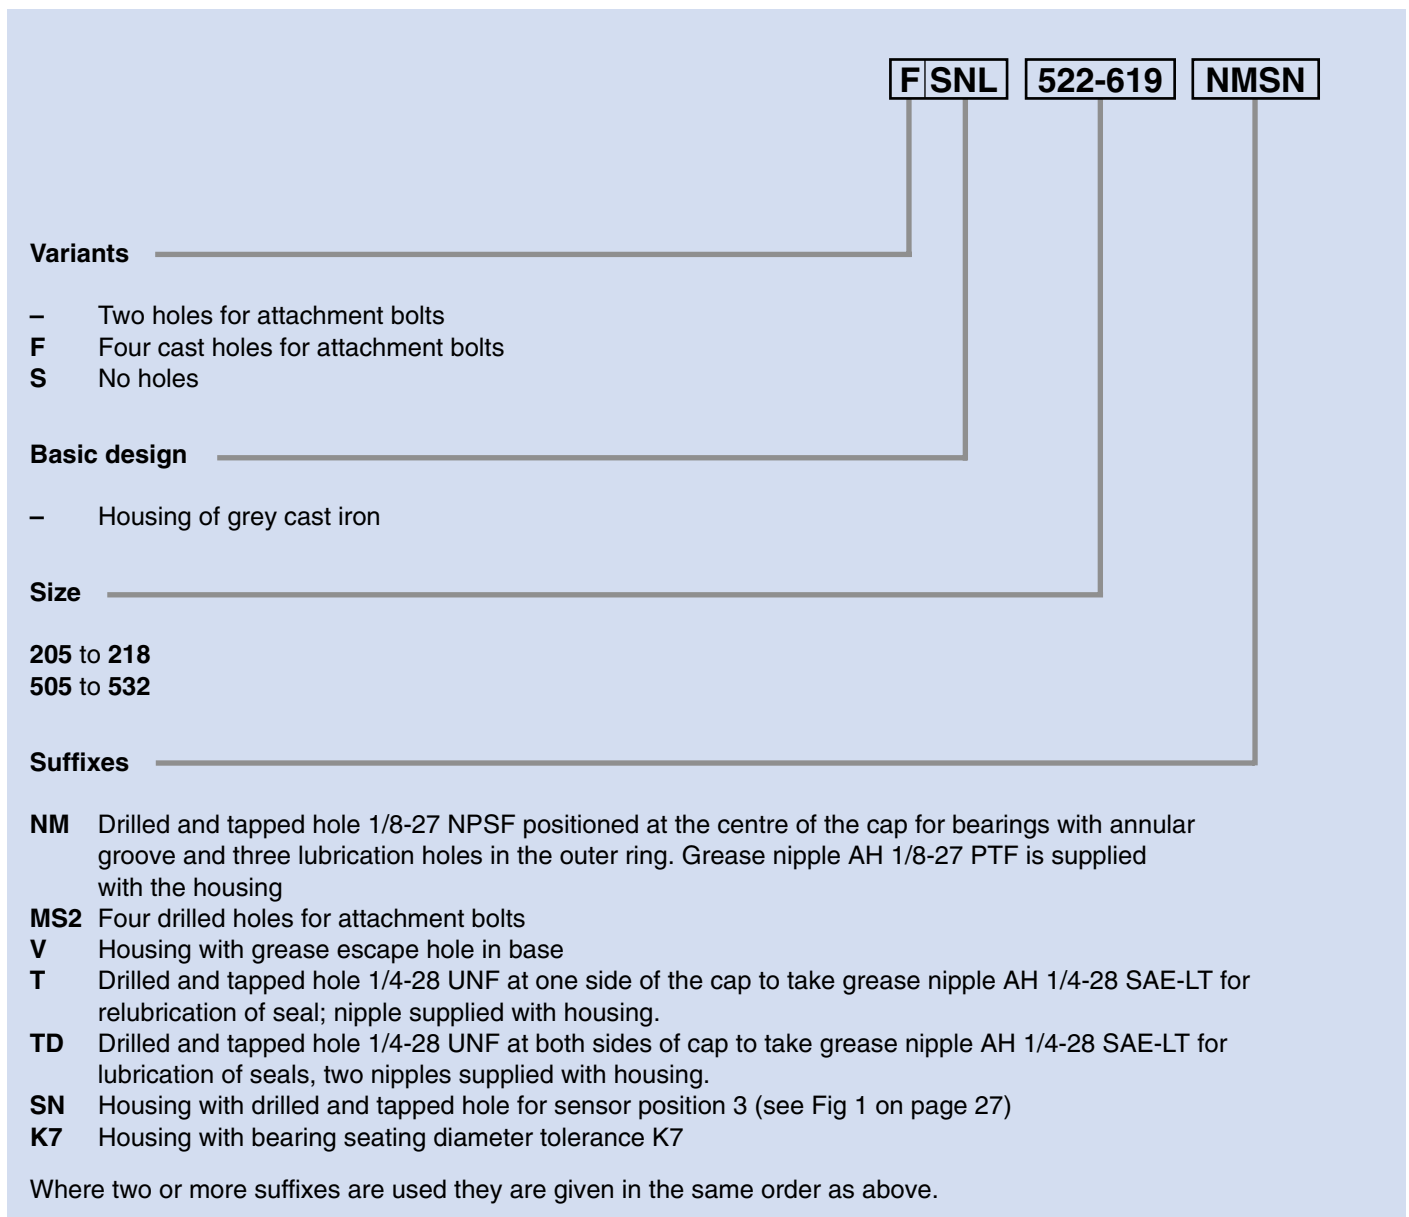

# Designations and housing data

## Designations

The designations used for SNL housings consist of a basic designation which identifies the design, material and size followed by any supplementary design-

nations needed to identify features which differ from the standard design. A dash (–) in the chart indicates that the features belong to the standard design.

*Designation chart*

# Load carrying ability

SNL plummer block housings are intended for loads acting vertically towards the base plate (support). If loads acting in other directions occur, checks should be made to ensure that the magnitude of the load is permissible for the housing, the bolts joining the housing cap and base, and for the attachment bolts.

## Load carrying ability of the housing

Guideline values for the breaking load  $P$  of the housing for various load directions are given in **Table 1**. Using these values and a safety factor selected with respect to the operating conditions, the permissible load for the housing can be calculated. In general engineering a safety factor of 6 is often used. For special purposes where extra strength and resistance to shock loads are required, SKF supplies as standard a range of dimensionally equivalent spheroidal graphite cast iron housings. For housings made of spheroidal graphite cast iron the values for  $P$  obtained from **Table 1** should be multiplied by 1,8.

It is important for the load carrying ability of the housing that the bolts joining cap and base are properly tightened in accordance with the values given in **Table 2** on page 48. The axial load carrying capacity of the housing is approximately 65 % of  $P_{180^\circ}$ . For load angles between 55 and 120° as well as for axial loads, or if the load acting parallel to the base plate (support surface) exceeds 5 % of  $P_{180^\circ}$ , the housing should be pinned to the support or a stop should be provided in the direction of the load.

*Breaking loads for SNL plummer block housings*

Table 1

Housing Size	Breaking loads for SNL housing

**Load carrying ability of bolts**

SNL plummer block housings are supplied with cap bolts (to join cap and base) to strength class 8.8 as standard. The guideline values for the yield point Q for the cap bolts are given in **Table 2** for various load directions as well as the corresponding maximum radial loads F.

# Other products for trouble-free operation

## Robust, high-performance standard bearings

SKF produces the self-aligning ball bearings, spherical roller bearings and CARB bearings normally incorporated in SNL plummer block housings in many sizes and several designs. All three bearing types are self-aligning. The degree of misalignment which can be accommodated depends on the bearing series and also on the seals used in the SNL housings.

The self-aligning ball bearings and spherical roller bearings can be used for both locating and non-locating bearing arrangements. At non-locating positions, the bearing outer ring is free to move axially in its seating in the housing bore. CARB bearings, on the other hand, accommodate axial displacements within the bearing and are always non-locating. It is usual to combine a CARB bearing at the non-locating side with a spherical roller bearing arranged as a locating bearing at the other side.

### Self-aligning ball bearings

Series 12, 22, 13 and 23 self-aligning ball bearings can be incorporated in SNL plummer block housings. Sealed self-aligning ball bearings of series 22-2RS1 are also appropriate, particularly where the surroundings in which the plummer blocks are to operate are heavily contaminated. Self-aligning ball bearings are available with tapered bore for mounting on adapter sleeves or with cylindrical bore.

### Spherical roller bearings

The spherical roller bearings which can be used in SKF plummer block housings of the SNL design are those of series 222, 232, 213 and 223. The bearings are available with tapered bore for mounting on adapter or withdrawal sleeves, or with cylindrical bore. Sealed spherical roller bearings of ISO Dimension Series 22 can also be incorporated.

### CARB bearings

These bearings are a more recent addition to the range of ball and roller bearings offered by SKF and are an SKF invention. CARB bearings of series C 22, C 23 and C 32 can be incorporated in SNL plummer block housings.

Although available in a caged as well as a full complement version, it is normally recommended that caged bearings are used in SNL housings. CARB bearings are available with a tapered bore for mounting on an adapter sleeve or a withdrawal sleeve, as well as with a cylindrical bore.

## For easy mounting – adapter and withdrawal sleeves

Generally the bearings with a tapered bore incorporated in SNL plummer block housings are mounted on smooth or stepped shafts with the aid of an adapter sleeve or, on stepped shafts only, a withdrawal sleeve. These sleeves are produced by SKF in appropriate sizes for the range of bearings which can be used in SNL housings. The adapter sleeves are the more popular as they are more versatile and are easier to mount.

### Adapter sleeves

These are slotted sleeves with a tapered outside diameter. The sizes used with bearings for SNL housings have an external taper of 1:12 and are supplied complete with lock nut and locking washer. Their dimensions are in accordance with ISO 2982-1:1995.

When using adapter sleeves on smooth shafts it is possible to locate the bearing at any position on the shaft and no additional axial location is required.

### Withdrawal sleeves

These are also slotted sleeves with a tapered outside diameter. The sizes used with bearings for SNL housings have an external taper of 1:12. Their dimensions are in accordance with ISO 2982-1:1995.

Bearings on withdrawal sleeves must be mounted against a fixed abutment, e.g. a shaft shoulder. The withdrawal sleeve must be secured in position after it has been pressed into the bearing bore by a lock nut or end plate on the shaft. The nuts are not supplied with the sleeves.

### More information about

- **self-aligning ball bearings and spherical roller bearings** (→ *General Catalogue 4000 and brochure 5100*)

## Other products

### Lock nuts

SKF lock nuts, also referred to as shaft nuts, are available in several designs to axially locate bearings on shaft ends. The most popular are those of series KM, KML and HM. These nuts have four or eight equally spaced slots in the outside diameter and are locked in position with locking washers or locking clips engaging a groove in the shaft. The nut dimensions are in accordance with ISO 2982-2:1995 as are the dimensions of the series MB and MBL locking washers and MS locking clips.

Other lock nuts produced by SKF include those of series KMT, KMTA, KMK and KMFE, that do not require a groove in the shaft.

### Lubricating greases for bearings

Lubrication is a necessity for proper bearing performance. Grease is normally used for applications involving SNL plummer blocks. SKF has put considerable effort into establishing a range of high-quality greases for ball and roller bearing lubrication.

The SKF SYSTEM 24 automatic lubricator can also be used with SNL plummer block housings. An adapter can be fitted to the standard drilled and tapped hole in the housing cap. It should be remembered that surplus grease should be able to leave the housing.

### SKF ConCentra roller bearing units

These units are plummer blocks with ready-lubricated bearings for easy installation. They comprise

- a one-piece plummer block housing of grey cast iron,
- a spherical roller bearing of series 222 with special inner ring,
- a special adapter sleeve, and
- two seals of nitrile rubber double lip type or two labyrinth seals.

The units are available in a locating and a non-locating version.

## Other bearing housings

To meet a wide variety of application demands, SKF produces a comprehensive range of bearing housings. The majority of these are of the split plummer block type but the SKF range also includes

- one-piece plummer block housings,
- flanged housings,
- take-up housings, and
- two-bearing housings.

Most of these housings are designed to take self-aligning bearings, and the range extends to shaft diameters up to and including 1 800 mm. Housings are available for oil lubrication as well as grease lubrication and also for bearings with cylindrical bore or with

tapered bore, mounted on adapter or withdrawal sleeves. Smooth or stepped shafts can be used.

Various different types of seal are used. Most housings are made of grey cast iron but spheroidal graphite cast iron or cast steel housings are included in the range.

For further information, please contact SKF.

## Condition monitoring equipment

The goals of condition monitoring are to maximise the time that the machine is functioning well and to minimise the number of breakdowns, thereby significantly reducing operating downtime and maintenance costs.

To achieve this, it is recommended that the bearing and machine condition be monitored either periodically or continuously. Condition monitoring enables incipient bearing damage to be detected and evaluated, so that bearing replacement can be scheduled for a time when the machine is not in operation, to avoid unplanned stoppages. Applied to all machinery (not just sensitive or problematic machines), condition monitoring improves machinery operation to an optimum level, often exceeding the original equipment specifications.

SKF provides a comprehensive range of condition monitoring equipment to measure all important parameters. These include

- temperature,
- speed,
- noise,
- oil condition,
- shaft alignment,
- vibration and
- bearing condition.

The range includes lightweight, hand-held devices for manual use as well as complex continuous monitoring systems for fixed installations in connection with preventive maintenance.

One example is the Machine Reliability Inspection System MARLIN™ which is at the leading edge of technology and allows storage of up to 2 000 measuring points. It can be used to diagnose machines and individual bearings and is backed by tailored software for the evaluation of the readings including enveloping vibration acceleration curves.

*Recording vibration values using an SKF Microlog data collection unit*

# The SKF Group - a worldwide corporation

SKF is an international industrial Group operating in some 130 countries and is world leader in bearings.

The company was founded in 1907 following the invention of the self-aligning ball bearing by Sven Wingquist and, after only a few years, SKF began to expand all over the world.

Today, SKF has some 45 000 employees and around 80 manufacturing facilities spread throughout the world. An international sales network includes a large number of sales companies and some 7 000 distributors and retailers. Worldwide availability of SKF products is supported by a comprehensive technical advisory service.

The key to success has been a consistent emphasis on maintaining the highest quality of its products and services. Continuous investment in research and

development has also played a vital role, resulting in many examples of epoch-making innovations.

The business of the Group consists of bearings, seals, special steel and a comprehensive range of other high-tech industrial components. The experience gained in these various fields provides SKF with the essential knowledge and expertise required in order to provide the customers with the most advanced engineering products and efficient service.

SKF

*The SKF Group is the first major bearing manufacturer to have been granted approval according to ISO 14001, the international standard for environmental management systems. The certificate is the most comprehensive of its kind and covers more than 60 SKF production units in 17 countries.*

*The SKF Engineering & Research Centre is situated just outside Utrecht in The Netherlands. In an area of 17 000 square metres (185 000 sq.ft) some 150 scientists, engineers and support staff are engaged in the further improvement of bearing performance. They are developing technologies aimed at achieving better materials, better designs, better lubricants and better seals – together leading to an even better understanding of the operation of a bearing in its application. This is also where the SKF Life Theory was evolved, enabling the design of bearings which are even more compact and offer even longer operational life.*

*SKF has developed the Channel concept in factories all over the world. This drastically reduces the lead time from raw material to end product as well as work in progress and finished goods in stock. The concept enables faster and smoother information flow, eliminates bottlenecks and bypasses unnecessary steps in production. The Channel team members have the knowledge and commitment needed to share the responsibility for fulfilling objectives in areas such as quality, delivery time, production flow etc.*

*SKF manufactures ball bearings, roller bearings and plain bearings. The smallest are just a few millimetres (a fraction of an inch) in diameter, the largest several metres. SKF also manufactures bearing and oil seals which prevent dirt from entering and lubricant from leaking out. SKF's subsidiaries CR and RFT S.p.A. are among the world's largest producers of seals.*
